# Chapter 1

# Xilinx Hardware Abstraction Layer API

# **Overview**

This section describes the Xilinx® Hardware Abstraction Layer API, These APIs are applicable for all processors supported by Xilinx.

# **Modules**

- Assert APIs
- IO interfacing APIs
- Definitions for available xilinx platforms
- Data types for Xilinx Software IP Cores
- Customized APIs for memory operations
- Xilinx software status codes
- Test utilities for memory and caches

# **Assert APIs**

# **Overview**

The xil\_assert.h file contains the assert related functions.

# **Macros**

- #define Xil\_AssertVoid(Expression)
- #define Xil\_AssertNonvoid(Expression)
- #define Xil\_AssertVoidAlways()
- #define Xil\_AssertNonvoidAlways()

# **Typedefs**

• typedef void(\* Xil\_AssertCallback) (const char8 \*File, s32 Line)

# **Functions**

- void Xil\_Assert (const char8 \*File, s32 Line)
- void XNullHandler (void \*NullParameter)
- void Xil\_AssertSetCallback (Xil\_AssertCallback Routine)

# **Variables**

- u32 Xil\_AssertStatus
- s32 Xil\_AssertWait

# **Macro Definition Documentation**

# #define Xil\_AssertVoid( Expression )

This assert macro is to be used for void functions. This in conjunction with the Xil\_AssertWait boolean can be used to accommodate tests so that asserts which fail allow execution to continue.

#### **Parameters**

Expression	expression to be evaluated. If it evaluates to false, the assert occurs.
------------	--

#### **Returns**

Returns void unless the Xil\_AssertWait variable is true, in which case no return is made and an infinite loop is entered.

# #define Xil\_AssertNonvoid( Expression )

This assert macro is to be used for functions that do return a value. This in conjunction with the Xil\_AssertWait boolean can be used to accommodate tests so that asserts which fail allow execution to continue.

#### **Parameters**

Expression	expression to be evaluated. If it evaluates to false, the assert occurs.
------------	--

#### Returns

Returns 0 unless the Xil\_AssertWait variable is true, in which case no return is made and an infinite loop is entered.

# #define Xil\_AssertVoidAlways( )

Always assert. This assert macro is to be used for void functions. Use for instances where an assert should always occur.

#### **Returns**

Returns void unless the Xil\_AssertWait variable is true, in which case no return is made and an infinite loop is entered.

# #define Xil\_AssertNonvoidAlways( )

Always assert. This assert macro is to be used for functions that do return a value. Use for instances where an assert should always occur.

#### **Returns**

Returns void unless the Xil\_AssertWait variable is true, in which case no return is made and an infinite loop is entered.

# **Typedef Documentation**

### typedef void(\* Xil\_AssertCallback) (const char8 \*File, s32 Line)

This data type defines a callback to be invoked when an assert occurs. The callback is invoked only when asserts are enabled

# **Function Documentation**

# void Xil\_Assert ( const char8 \* File, s32 Line )

Implement assert. Currently, it calls a user-defined callback function if one has been set. Then, it potentially enters an infinite loop depending on the value of the Xil\_AssertWait variable.

#### **Parameters**

file	filename of the source
line	linenumber within File

#### Returns

None.

#### Note

None.

# void XNullHandler ( void \* NullParameter )

Null handler function. This follows the XInterruptHandler signature for interrupt handlers. It can be used to assign a null handler (a stub) to an interrupt controller vector table.

#### **Parameters**

NullParameter	arbitrary void pointer and not used.
---------------	--------------------------------------

#### Returns

None.

#### Note

None.

# void Xil\_AssertSetCallback ( Xil\_AssertCallback Routine )

Set up a callback function to be invoked when an assert occurs. If a callback is already installed, then it will be replaced.

#### **Parameters**

routine	callback to be invoked when an assert is taken
---------	--

#### Returns

None.

#### Note

This function has no effect if NDEBUG is set

# **Variable Documentation**

#### u32 Xil\_AssertStatus

This variable allows testing to be done easier with asserts. An assert sets this variable such that a driver can evaluate this variable to determine if an assert occurred.

### s32 Xil\_AssertWait

This variable allows the assert functionality to be changed for testing such that it does not wait infinitely. Use the debugger to disable the waiting during testing of asserts.

# IO interfacing APIs

# **Overview**

The xil\_io.h file contains the interface for the general IO component, which encapsulates the Input/Output functions for processors that do not require any special I/O handling.

# **Functions**

- u16 Xil\_EndianSwap16 (u16 Data)
- u32 Xil\_EndianSwap32 (u32 Data)
- static INLINE u8 Xil\_In8 (UINTPTR Addr)
- static INLINE u16 Xil\_In16 (UINTPTR Addr)
- static INLINE u32 Xil\_In32 (UINTPTR Addr)
- static INLINE u64 Xil\_In64 (UINTPTR Addr)
- static INLINE void Xil\_Out8 (UINTPTR Addr, u8 Value)
- static INLINE void Xil\_Out16 (UINTPTR Addr, u16 Value)
- static INLINE void Xil Out32 (UINTPTR Addr, u32 Value)
- static INLINE void Xil\_Out64 (UINTPTR Addr, u64 Value)
- static INLINE u16 Xil\_In16LE (UINTPTR Addr)
- static INLINE u32 Xil\_In32LE (UINTPTR Addr)
- static INLINE void Xil\_Out16LE (UINTPTR Addr, u16 Value)
- static INLINE void Xil\_Out32LE (UINTPTR Addr, u32 Value)
- static INLINE u16 Xil\_In16BE (UINTPTR Addr)
- static INLINE u32 Xil\_In32BE (UINTPTR Addr)
- static INLINE void Xil\_Out16BE (UINTPTR Addr, u16 Value)
- static INLINE void Xil\_Out32BE (UINTPTR Addr, u32 Value)

# **Function Documentation**

# u16 Xil\_EndianSwap16 ( u16 Data )

Perform a 16-bit endian converion.

#### **Parameters**

Data	16 bit value to be converted	
------	------------------------------	--

#### **Returns**

converted value.

# u32 Xil\_EndianSwap32 ( u32 Data )

Perform a 32-bit endian converion.

#### **Parameters**

Data	32 bit value to be converted
------	------------------------------

#### **Returns**

converted value.

# static INLINE u8 Xil\_In8 ( UINTPTR Addr ) [static]

Performs an input operation for an 8-bit memory location by reading from the specified address and returning the Value read from that address.

#### **Parameters**

Addr	contains the address to perform the input operation at.
------	---

#### **Returns**

The Value read from the specified input address.

#### Note

None.

### static INLINE u16 Xil\_In16 ( UINTPTR Addr ) [static]

Performs an input operation for a 16-bit memory location by reading from the specified address and returning the Value read from that address.

#### **Parameters**

Addr	contains the address to perform the input operation at.
------	---

#### Returns

The Value read from the specified input address.

#### Note

None.

# static INLINE u32 Xil\_In32 ( UINTPTR Addr ) [static]

Performs an input operation for a 32-bit memory location by reading from the specified address and returning the Value read from that address.

#### **Parameters**

Addr	contains the address to perform the input operation at.
------	---

#### Returns

The Value read from the specified input address.

#### Note

None.

# static INLINE u64 Xil\_In64 ( UINTPTR Addr ) [static]

Performs an input operation for a 64-bit memory location by reading the specified Value to the specified address.

#### **Parameters**

Addr	contains the address to perform the output operation at.
Value	contains the Value to be output at the specified address.

#### **Returns**

None.

#### Note

None.

# static INLINE void Xil\_Out8 ( UINTPTR Addr, u8 Value ) [static]

Performs an output operation for an 8-bit memory location by writing the specified Value to the specified address.

#### **Parameters**

Addr	contains the address to perform the output operation at.
Value	contains the Value to be output at the specified address.

#### **Returns**

None.

#### Note

None.

# static INLINE void Xil Out16 ( UINTPTR Addr, u16 Value ) [static]

Performs an output operation for a 16-bit memory location by writing the specified Value to the specified address.

#### **Parameters**

Addr	contains the address to perform the output operation at.
Value	contains the Value to be output at the specified address.

#### **Returns**

None.

#### Note

None.

# static INLINE void Xil\_Out32 ( UINTPTR Addr, u32 Value ) [static]

Performs an output operation for a 32-bit memory location by writing the specified Value to the specified address.

#### **Parameters**

Addr	contains the address to perform the output operation at.
Value	contains the Value to be output at the specified address.

#### **Returns**

None.

#### Note

None.

# static INLINE void Xil\_Out64 ( UINTPTR Addr, u64 Value ) [static]

Performs an output operation for a 64-bit memory location by writing the specified Value to the specified address.

#### **Parameters**

Addr	contains the address to perform the output operation at.
Value	contains the Value to be output at the specified address.

#### Returns

None.

#### Note

None.

# static INLINE u16 Xil\_In16LE ( UINTPTR Addr ) [static]

Perform a little-endian input operation for a 16-bit memory location by reading from the specified address and returning the value read from that address.

#### **Parameters**

Addr contains the address at which to perform the input operation.	on.
--	-----

#### **Returns**

The value read from the specified input address with the proper endianness. The return value has the same endianness as that of the processor. For example, if the processor is big-endian, the return value is the byte-swapped value read from the address.

# static INLINE u32 Xil In32LE ( UINTPTR Addr ) [static]

Perform a little-endian input operation for a 32-bit memory location by reading from the specified address and returning the value read from that address.

#### **Parameters**

Addr	contains the address at which to perform the input operation.
------	---

#### Returns

The value read from the specified input address with the proper endianness. The return value has the same endianness as that of the processor. For example, if the processor is big-endian, the return value is the byte-swapped value read from the address.

### static INLINE void Xil\_Out16LE ( UINTPTR Addr, u16 Value ) [static]

Perform a little-endian output operation for a 16-bit memory location by writing the specified value to the specified address.

#### **Parameters**

Addr	contains the address at which to perform the output operation.
Value	contains the value to be output at the specified address. The value has the same endianness as that of the processor. For example, if the processor is big-endian, the byteswapped value is written to the address.

# static INLINE void Xil\_Out32LE ( UINTPTR Addr, u32 Value ) [static]

Perform a little-endian output operation for a 32-bit memory location by writing the specified value to the specified address.

#### **Parameters**

Addr	contains the address at which to perform the output operation.
Value	contains the value to be output at the specified address. The value has the same endianness as that of the processor. For example, if the processor is big-endian, the byteswapped value is written to the address.

# static INLINE u16 Xil\_In16BE ( UINTPTR Addr ) [static]

Perform an big-endian input operation for a 16-bit memory location by reading from the specified address and returning the value read from that address.

#### **Parameters**

Addr	contains the address at which to perform the input operation.
------	---

#### Returns

The value read from the specified input address with the proper endianness. The return value has the same endianness as that of the processor. For example, if the processor is little-endian, the return value is the byte-swapped value read from the address.

### static INLINE u32 Xil\_In32BE ( UINTPTR Addr ) [static]

Perform a big-endian input operation for a 32-bit memory location by reading from the specified address and returning the value read from that address.

#### **Parameters**

Addr	contains the address at which to perform the input operation.
------	---

#### Returns

The value read from the specified input address with the proper endianness. The return value has the same endianness as that of the processor. For example, if the processor is little-endian, the return value is the byte-swapped value read from the address.

# static INLINE void Xil\_Out16BE ( UINTPTR Addr, u16 Value ) [static]

Perform a big-endian output operation for a 16-bit memory location by writing the specified value to the specified address.

#### **Parameters**

Addr	contains the address at which to perform the output operation.
Value	contains the value to be output at the specified address. The value has the same endianness as that of the processor. For example, if the processor is little-endian, the byteswapped value is written to the address.

# static INLINE void Xil\_Out32BE ( UINTPTR Addr, u32 Value ) [static]

Perform a big-endian output operation for a 32-bit memory location by writing the specified value to the specified address.

#### **Parameters**

Addr	contains the address at which to perform the output operation.
Value	contains the value to be output at the specified address. The value has the same endianness as that of the processor. For example, if the processor is little-endian, the byteswapped value is written to the address.

# **Definitions for available xilinx platforms**

# **Overview**

The xplatform\_info.h file contains definitions for various available Xilinx® platforms.

# **Functions**

- u32 XGetPlatform\_Info ()
- u32 XGetPSVersion\_Info ()
- u32 XGet\_Zynq\_UltraMp\_Platform\_info ()

# **Function Documentation**

# u32 XGetPlatform\_Info()

This API is used to provide information about platform.

#### **Parameters**

None.	
-------	--

#### **Returns**

The information about platform defined in xplatform\_info.h

### u32 XGetPSVersion\_Info( )

This API is used to provide information about PS Silicon version.

#### **Parameters**

None.	

#### Returns

The information about PS Silicon version.

# u32 XGet\_Zynq\_UltraMp\_Platform\_info ( )

This API is used to provide information about zyng ultrascale MP platform.

#### **Parameters**

None.	
-------	--

#### Returns

The information about zyng ultrascale MP platform defined in xplatform\_info.h

# **Data types for Xilinx Software IP Cores**

# **Overview**

The xil\_types.h file contains basic types for Xilinx® software IP cores. These data types are applicable for all processors supported by Xilinx.

# **Macros**

- #define XIL\_COMPONENT\_IS\_READY
- #define XIL\_COMPONENT\_IS\_STARTED

# **New types**

New simple types.

- typedef uint8\_t u8
- typedef uint16\_t u16
- typedef uint32\_t u32
- typedef char char8
- typedef int8\_t **s8**
- typedef int16\_t **s16**

- typedef int32\_t **s32**
- typedef int64\_t s64
- typedef uint64\_t u64
- typedef int sint32
- typedef intptr\_t INTPTR
- typedef uintptr\_t UINTPTR
- typedef ptrdiff\_t **PTRDIFF**
- typedef long LONG
- typedef unsigned long **ULONG**
- typedef void(\* XInterruptHandler) (void \*InstancePtr)
- typedef void(\* XExceptionHandler) (void \*InstancePtr)
- #define \_\_XUINT64\_\_\_
- #define XUINT64\_MSW(x)
- #define XUINT64\_LSW(x)
- #define **ULONG64\_HI\_MASK**
- #define ULONG64\_LO\_MASK
- #define UPPER\_32\_BITS(n)
- #define LOWER\_32\_BITS(n)

### **Macro Definition Documentation**

# #define XIL\_COMPONENT\_IS\_READY

component has been initialized

# #define XIL\_COMPONENT\_IS\_STARTED

component has been started

# #define XUINT64 MSW( x )

Return the most significant half of the 64 bit data type.

#### **Parameters**

A TO THE OT SIL WOLD
----------------------

#### Returns

The upper 32 bits of the 64 bit word.

# #define XUINT64\_LSW( x )

Return the least significant half of the 64 bit data type.

#### **Parameters**

X		is the 64 bit word.
---	--	---------------------

#### **Returns**

The lower 32 bits of the 64 bit word.

# #define UPPER\_32\_BITS( n )

return bits 32-63 of a number

#### **Parameters**

n	: the number we're accessing
---	------------------------------

#### Returns

bits 32-63 of number

#### Note

A basic shift-right of a 64- or 32-bit quantity. Use this to suppress the "right shift count >= width of type" warning when that quantity is 32-bits.

# #define LOWER\_32\_BITS( n )

return bits 0-31 of a number

#### **Parameters**

n	: the number we're accessing
---	------------------------------

#### **Returns**

bits 0-31 of number

# **Typedef Documentation**

### typedef uint8\_t u8

guarded against xbasic\_types.h.

### typedef char char8

xbasic\_types.h does not typedef s\* or u64

### typedef void(\* XInterruptHandler) (void \*InstancePtr)

This data type defines an interrupt handler for a device. The argument points to the instance of the component

### typedef void(\* XExceptionHandler) (void \*InstancePtr)

This data type defines an exception handler for a processor. The argument points to the instance of the component

# **Customized APIs for memory operations**

# **Overview**

The xil\_mem.h file contains prototypes for function related to memory operations. These APIs are applicable for all processors supported by Xilinx®.

# **Functions**

void Xil\_MemCpy (void \*dst, const void \*src, u32 cnt)

# **Function Documentation**

void Xil\_MemCpy ( void \* dst, const void \* src, u32 cnt )

This function copies memory from once location to other.

#### **Parameters**

dst	pointer pointing to destination memory
src	pointer pointing to source memory
cnt	32 bit length of bytes to be copied

# Xilinx software status codes

# **Overview**

The xstatus.h file contains Xilinx® software status codes. Status codes have their own data type called int. These codes are used throughout the Xilinx device drivers.

# Test utilities for memory and caches

# **Overview**

The xil\_testcache.h, xil\_testio.h and the xil\_testmem.h files contain utility functions to test cache and memory. Details of supported tests and subtests are listed below.

- Cache test : xil\_testcache.h contains utility functions to test cache.
- I/O test: The Xil\_testio.h file contains endian related memory IO functions. A subset of the memory tests can be selected or all of the tests can be run in order. If there is an error detected by a subtest, the test stops and the failure code is returned. Further tests are not run even if all of the tests are selected.
- **Memory test**: The xil\_testmem.h file contains utility functions to test memory. A subset of the memory tests can be selected or all of the tests can be run in order. If there is an error detected by a subtest, the test stops and the failure code is returned. Further tests are not run even if all of the tests are selected. Following are descriptions of Memory test subtests:
  - XIL\_TESTMEM\_ALLMEMTESTS: Runs all of the subtests.
  - XIL\_TESTMEM\_INCREMENT: Incrementing Value Test. This test starts at XIL\_TESTMEM\_INIT\_VALUE and uses the incrementing value as the test value for memory.
  - XIL\_TESTMEM\_WALKONES: Walking Ones Test. This test uses a walking 1 as the test value for memory.

```
location 1 = 0 \times 000000001
location 2 = 0 \times 000000002
```

• XIL\_TESTMEM\_WALKZEROS: Walking Zero's Test. This test uses the inverse value of the walking ones test as the test value for memory.

```
location 1 = 0xFFFFFFFE
location 2 = 0xFFFFFFFD
...
```

- XIL\_TESTMEM\_INVERSEADDR: Inverse Address Test. This test uses the inverse of the address of the location under test as the test value for memory.
- XIL\_TESTMEM\_FIXEDPATTERN: Fixed Pattern Test. This test uses the provided patters as the test value for memory. If zero is provided as the pattern the test uses 0xDEADBEEF.

**WARNING:** The tests are **DESTRUCTIVE**. Run before any initialized memory spaces have been set up. The address provided to the memory tests is not checked for validity except for the NULL case. It is possible to provide a code-space pointer for this test to start with and ultimately destroy executable code causing random failures.

#### **Note**

Used for spaces where the address range of the region is smaller than the data width. If the memory range is greater than 2 \*\* width, the patterns used in XIL\_TESTMEM\_WALKONES and XIL\_TESTMEM\_WALKZEROS will repeat on a boundary of a power of two making it more difficult to detect addressing errors. The XIL\_TESTMEM\_INCREMENT and XIL\_TESTMEM\_INVERSEADDR tests suffer the same problem. Ideally, if large blocks of memory are to be tested, break them up into smaller regions of memory to allow the test patterns used not to repeat over the region tested.

# **Functions**

- s32 Xil\_TestIO8 (u8 \*Addr, s32 Length, u8 Value)
- s32 Xil\_TestIO16 (u16 \*Addr, s32 Length, u16 Value, s32 Kind, s32 Swap)
- s32 Xil\_TestIO32 (u32 \*Addr, s32 Length, u32 Value, s32 Kind, s32 Swap)
- s32 Xil\_TestMem32 (u32 \*Addr, u32 Words, u32 Pattern, u8 Subtest)
- s32 Xil\_TestMem16 (u16 \*Addr, u32 Words, u16 Pattern, u8 Subtest)
- s32 Xil\_TestMem8 (u8 \*Addr, u32 Words, u8 Pattern, u8 Subtest)

# **Memory subtests**

- #define XIL\_TESTMEM\_ALLMEMTESTS
- #define XIL TESTMEM INCREMENT
- #define XIL\_TESTMEM\_WALKONES
- #define XIL\_TESTMEM\_WALKZEROS
- #define XIL TESTMEM INVERSEADDR
- #define XIL TESTMEM FIXEDPATTERN
- #define XIL TESTMEM MAXTEST

# **Macro Definition Documentation**

### #define XIL\_TESTMEM\_ALLMEMTESTS

See the detailed description of the subtests in the file description.

# **Function Documentation**

# s32 Xil\_TestIO8 ( u8 \* Addr, s32 Length, u8 Value )

Perform a destructive 8-bit wide register IO test where the register is accessed using Xil\_Out8 and Xil\_In8, and comparing the written values by reading them back.

#### **Parameters**

Addr	a pointer to the region of memory to be tested.
Length	Length of the block.
Value	constant used for writting the memory.

#### **Returns**

- -1 is returned for a failure
- 0 is returned for a pass

# s32 Xil\_TestIO16 ( u16 \* Addr, s32 Length, u16 Value, s32 Kind, s32 Swap )

Perform a destructive 16-bit wide register IO test. Each location is tested by sequentially writing a 16-bit wide register, reading the register, and comparing value. This function tests three kinds of register IO functions, normal register IO, little-endian register IO, and big-endian register IO. When testing little/big-endian IO, the function performs the following sequence, Xil\_Out16LE/Xil\_Out16BE, Xil\_In16, Compare In-Out values, Xil\_Out16, Xil\_In16LE/Xil\_In16BE, Compare In-Out values. Whether to swap the read-in value before comparing is controlled by the 5th argument.

#### **Parameters**

Addr	a pointer to the region of memory to be tested.
Length	Length of the block.
Value	constant used for writting the memory.
Kind	Type of test. Acceptable values are: XIL_TESTIO_DEFAULT, XIL_TESTIO_LE, XIL_TESTIO_BE.
Swap	indicates whether to byte swap the read-in value.

#### Returns

- -1 is returned for a failure
- 0 is returned for a pass

### s32 Xil TestlO32 ( u32 \* Addr, s32 Length, u32 Value, s32 Kind, s32 Swap )

Perform a destructive 32-bit wide register IO test. Each location is tested by sequentially writing a 32-bit wide register, reading the register, and comparing value. This function tests three kinds of register IO functions, normal register IO, little-endian register IO, and big-endian register IO. When testing little/big-endian IO, the function perform the following sequence, Xil\_Out32LE/ Xil\_Out32BE, Xil\_In32, Compare, Xil\_Out32, Xil\_In32LE/Xil\_In32BE, Compare. Whether to swap the read-in value \*before comparing is controlled by the 5th argument.

#### **Parameters**

Addr	a pointer to the region of memory to be tested.			
Length	Length of the block.			
Value	constant used for writting the memory.			
Kind	type of test. Acceptable values are: XIL_TESTIO_DEFAULT, XIL_TESTIO_L XIL_TESTIO_BE.			
Swap	indicates whether to byte swap the read-in value.			

#### **Returns**

- -1 is returned for a failure
- 0 is returned for a pass

# s32 Xil\_TestMem32 ( u32 \* Addr, u32 Words, u32 Pattern, u8 Subtest )

Perform a destructive 32-bit wide memory test.

#### **Parameters**

Addr	pointer to the region of memory to be tested.		
Words	length of the block.		
Pattern	constant used for the constant pattern test, if 0, 0xDEADBEEF is used.		
Subtest type selected. See xil_testmem.h for possible values.			

#### Returns

- 0 is returned for a pass
- 1 is returned for a failure

#### Note

Used for spaces where the address range of the region is smaller than the data width. If the memory range is greater than 2 \*\* Width, the patterns used in XIL\_TESTMEM\_WALKONES and XIL\_TESTMEM\_WALKZEROS will repeat on a boundry of a power of two making it more difficult to detect addressing errors. The XIL\_TESTMEM\_INCREMENT and XIL\_TESTMEM\_INVERSEADDR tests suffer the same problem. Ideally, if large blocks of memory are to be tested, break them up into smaller regions of memory to allow the test patterns used not to repeat over the region tested.

### s32 Xil\_TestMem16 ( u16 \* Addr, u32 Words, u16 Pattern, u8 Subtest )

Perform a destructive 16-bit wide memory test.

#### **Parameters**

Addr	pointer to the region of memory to be tested.		
Words	length of the block.		
Pattern	constant used for the constant Pattern test, if 0, 0xDEADBEEF is used.		
Subtest type of test selected. See xil_testmem.h for possible values.			

#### Returns

- -1 is returned for a failure
- 0 is returned for a pass

#### Note

Used for spaces where the address range of the region is smaller than the data width. If the memory range is greater than 2 \*\* Width, the patterns used in XIL\_TESTMEM\_WALKONES and XIL\_TESTMEM\_WALKZEROS will repeat on a boundry of a power of two making it more difficult to detect addressing errors. The XIL\_TESTMEM\_INCREMENT and XIL\_TESTMEM\_INVERSEADDR tests suffer the same problem. Ideally, if large blocks of memory are to be tested, break them up into smaller regions of memory to allow the test patterns used not to repeat over the region tested.

# s32 Xil\_TestMem8 ( u8 \* Addr, u32 Words, u8 Pattern, u8 Subtest )

Perform a destructive 8-bit wide memory test.

#### **Parameters**

Addr	pointer to the region of memory to be tested.		
Words	length of the block.		
Pattern	constant used for the constant pattern test, if 0, 0xDEADBEEF is used.		
Subtest type of test selected. See xil_testmem.h for possible values.			

#### **Returns**

- -1 is returned for a failure
- 0 is returned for a pass

#### Note

Used for spaces where the address range of the region is smaller than the data width. If the memory range is greater than 2 \*\* Width, the patterns used in XIL\_TESTMEM\_WALKONES and XIL\_TESTMEM\_WALKZEROS will repeat on a boundry of a power of two making it more difficult to detect addressing errors. The XIL\_TESTMEM\_INCREMENT and XIL\_TESTMEM\_INVERSEADDR tests suffer the same problem. Ideally, if large blocks of memory are to be tested, break them up into smaller regions of memory to allow the test patterns used not to repeat over the region tested.

# Chapter 2

# Microblaze Processor API

# **Overview**

This section provides a linked summary and detailed descriptions of the Microblaze Processor APIs.

# **Modules**

- Microblaze Pseudo-asm Macros and Interrupt handling APIs
- Microblaze exception APIs
- Microblaze Processor Cache APIs
- MicroBlaze Processor FSL Macros
- Microblaze PVR access routines and macros
- Sleep Routines for Microblaze

# Microblaze Pseudo-asm Macros and Interrupt handling APIs

# **Overview**

Standalone includes macros to provide convenient access to various registers in the MicroBlaze processor. Some of these macros are very useful within exception handlers for retrieving information about the exception. Also, the interrupt handling functions help manage interrupt handling on MicroBlaze processor devices. To use these functions, include the header file mb\_interface. h in your source code

# **Functions**

- void microblaze\_register\_handler (XInterruptHandler Handler, void \*DataPtr)
- void microblaze\_register\_exception\_handler (u32 ExceptionId, Xil\_ExceptionHandler Handler, void \*DataPtr)

# Microblaze pseudo-asm macros

The following is a summary of the MicroBlaze processor pseudo-asm macros.

- #define mfgpr(rn)
- #define mfmsr()
- #define mfear()
- #define mfeare()
- #define mfesr()
- #define mffsr()

# **Macro Definition Documentation**

# #define mfgpr( rn )

Return value from the general purpose register (GPR) rn.

#### **Parameters**

rn	General purpose register to be read.
	Corroral parpose register to be read.

# #define mfmsr( )

Return the current value of the MSR.

#### **Parameters**

None	
------	--

# #define mfear( )

Return the current value of the Exception Address Register (EAR).

#### **Parameters**

# #define mfesr( )

Return the current value of the Exception Status Register (ESR).

#### **Parameters**

None	

# #define mffsr( )

Return the current value of the Floating Point Status (FPS).

#### **Parameters**

None	

# **Function Documentation**

# void microblaze\_register\_handler ( XInterruptHandler Handler, void \* DataPtr )

Registers a top-level interrupt handler for the MicroBlaze. The argument provided in this call as the DataPtr is used as the argument for the handler when it is called.

#### **Parameters**

Handler	Top level handler.
DataPtr	a reference to data that will be passed to the handler when it gets called.

#### **Returns**

None.

# void microblaze\_register\_exception\_handler ( u32 ExceptionId, XiI\_ExceptionHandler Handler, void \* DataPtr )

Registers an exception handler for the MicroBlaze. The argument provided in this call as the DataPtr is used as the argument for the handler when it is called.

#### **Parameters**

ExceptionId	is the id of the exception to register this handler for.
Top level handler.	
DataPtr is a reference to data that will be passed to the handler when it g	

#### Returns

None.

#### Note

None.

# Microblaze exception APIs

# **Overview**

The xil\_exception.h file, available in the <install-directory>/src/microblaze folder, contains Microblaze specific exception related APIs and macros. Application programs can use these APIs for various exception related operations. For example, enable exception, disable exception, register exception hander.

#### Note

To use exception related functions, xil\_exception.h must be added in source code

# **Data Structures**

struct MB\_ExceptionVectorTableEntry

# **Typedefs**

- typedef void(\* Xil\_ExceptionHandler) (void \*Data)
- typedef void(\* XInterruptHandler) (void \*InstancePtr)

# **Functions**

- void Xil\_ExceptionInit (void)
- void Xil\_ExceptionEnable (void)
- void Xil\_ExceptionDisable (void)
- void Xil\_ExceptionRegisterHandler (u32 Id, Xil\_ExceptionHandler Handler, void \*Data)
- void Xil\_ExceptionRemoveHandler (u32 ld)

# **Data Structure Documentation**

# struct MB ExceptionVectorTableEntry

Currently HAL is an augmented part of standalone BSP, so the old definition of MB\_ExceptionVectorTableEntry is used here.

# **Typedef Documentation**

# typedef void(\* Xil\_ExceptionHandler) (void \*Data)

This typedef is the exception handler function.

# typedef void(\* XInterruptHandler) (void \*InstancePtr)

This data type defines an interrupt handler for a device. The argument points to the instance of the component

# **Function Documentation**

# void Xil\_ExceptionInit ( void )

Initialize exception handling for the processor. The exception vector table is setup with the stub handler for all exceptions.

Parameters			
None.			
Returns			
None.			
void Xil_ExceptionEna	able (void)		
Enable Exceptions.			
Returns			
None.			
void Xil_ExceptionDisable ( void )			
Disable Exceptions.			
Parameters			
None.			
Returns			

None.

# void Xil\_ExceptionRegisterHandler ( u32 Id, Xil\_ExceptionHandler Handler, void \* Data )

Makes the connection between the Id of the exception source and the associated handler that is to run when the exception is recognized. The argument provided in this call as the DataPtr is used as the argument for the handler when it is called.

#### **Parameters**

ld	contains the 32 bit ID of the exception source and should be XIL_EXCEPTION_INT or be in the range of 0 to XIL_EXCEPTION_LAST. See xil_mach_exception.h for further information.
Handler	handler function to be registered for exception
Data	a reference to data that will be passed to the handler when it gets called.

### void Xil\_ExceptionRemoveHandler ( u32 ld )

Removes the handler for a specific exception Id. The stub handler is then registered for this exception Id.

#### **Parameters**

Id	contains	the	32	bit	ID	of	the	exception	source	and	should	be
							_	e of 0 to XIL	_EXCEF	PTION	LAST.	See
	xexceptio	n_l.h	for fu	ırthe	r info	orma	ation.					

# **Microblaze Processor Cache APIs**

# **Overview**

Cache functions provide access to cache related operations such as flush and invalidate for instruction and data caches. It gives option to perform the cache operations on a single cacheline, a range of memory and an entire cache.

#### Note

# **Macros**

- void Xil\_L1DCacheInvalidate()
- void Xil\_L2CacheInvalidate()
- void Xil\_L1DCacheInvalidateRange(Addr, Len)
- void Xil\_L2CacheInvalidateRange(Addr, Len)
- void Xil\_L1DCacheFlushRange(Addr, Len)
- void Xil\_L2CacheFlushRange(Addr, Len)

- void Xil\_L1DCacheFlush()
- void Xil\_L2CacheFlush()
- void Xil\_L1ICacheInvalidateRange(Addr, Len)
- void Xil\_L1lCacheInvalidate()
- void Xil\_L1DCacheEnable()
- void Xil\_L1DCacheDisable()
- void Xil\_L1ICacheEnable()
- void Xil\_L1ICacheDisable()
- void Xil\_DCacheEnable()
- void Xil\_ICacheEnable()

# **Functions**

- void Xil\_DCacheDisable (void)
- void Xil\_ICacheDisable (void)

# **Macro Definition Documentation**

# void Xil\_L1DCacheInvalidate( )

Invalidate the entire L1 data cache. If the cacheline is modified (dirty), the modified contents are lost.

Parameters	
None.	
Returns	

# Note

None.

Processor must be in real mode.

# void Xil\_L2CacheInvalidate( )

Invalidate the entire L2 data cache. If the cacheline is modified (dirty), the modified contents are lost.

#### **Parameters**

None.	

#### **Returns**

None.

#### Note

Processor must be in real mode.

# void Xil\_L1DCacheInvalidateRange( Addr, Len )

Invalidate the L1 data cache for the given address range. If the bytes specified by the address (Addr) are cached by the L1 data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the modified contents are lost.

#### **Parameters**

Addr	is address of ragne to be invalidated.
Len	is the length in bytes to be invalidated.

#### Returns

None.

#### Note

Processor must be in real mode.

# void Xil\_L2CacheInvalidateRange( Addr, Len )

Invalidate the L1 data cache for the given address range. If the bytes specified by the address (Addr) are cached by the L1 data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the modified contents are lost.

#### **Parameters**

Addr	address of ragne to be invalidated.
Len	length in bytes to be invalidated.

#### **Returns**

None.

#### Note

Processor must be in real mode.

# void Xil\_L1DCacheFlushRange( Addr, Len )

Flush the L1 data cache for the given address range. If the bytes specified by the address (Addr) are cached by the data cache, and is modified (dirty), the cacheline will be written to system memory. The cacheline will also be invalidated.

#### **Parameters**

Addr	the starting address of the range to be flushed.
Len	length in byte to be flushed.

#### **Returns**

None.

### void Xil L2CacheFlushRange( Addr, Len )

Flush the L2 data cache for the given address range. If the bytes specified by the address (Addr) are cached by the data cache, and is modified (dirty), the cacheline will be written to system memory. The cacheline will also be invalidated.

#### **Parameters**

Addr	the starting address of the range to be flushed.
Len	length in byte to be flushed.

#### Returns

None.

# void Xil\_L1DCacheFlush( )

Flush the entire L1 data cache. If any cacheline is dirty, the cacheline will be written to system memory. The entire data cache will be invalidated.

#### **Returns**

None.

# void Xil\_L2CacheFlush( )

Flush the entire L2 data cache. If any cacheline is dirty, the cacheline will be written to system memory. The entire data cache will be invalidated.

#### Returns

None.

### void Xil\_L1lCacheInvalidateRange( Addr, Len )

Invalidate the instruction cache for the given address range.

#### **Parameters**

Addr	is address of ragne to be invalidated.
Len	is the length in bytes to be invalidated.

#### **Returns**

None.

### void Xil\_L1lCacheInvalidate( )

Invalidate the entire instruction cache.

#### **Parameters**

#### **Returns**

None.

### void Xil\_L1DCacheEnable( )

Enable the L1 data cache.

#### **Returns**

None.

### void Xil\_L1DCacheDisable( )

Disable the L1 data cache.

#### **Returns**

None.

#### Note

This is processor specific.

void Xil_L1lCacheEnable( )
Enable the instruction cache.  Returns
None.
Note
This is processor specific.
void Xil_L1lCacheDisable( )
Disable the L1 Instruction cache.  Returns
None.
Note
This is processor specific.
void Xil_DCacheEnable( )
Enable the data cache.
Parameters
None
Returns
None.
void Xil_lCacheEnable( )
Enable the instruction cache.
Parameters
None
Returns
None.

# **Function Documentation**

Note

### void Xil\_DCacheDisable ( void )

Disable the data cache.

#### **Parameters**

None	
------	--

#### Returns

None.

### void Xil\_ICacheDisable ( void )

Disable the instruction cache.

#### **Parameters**

#### **Returns**

None.

### MicroBlaze Processor FSL Macros

### **Overview**

Microblaze BSP includes macros to provide convenient access to accelerators connected to the MicroBlaze Fast Simplex Link (FSL) Interfaces. To use these functions, include the header file fsl.h in your source code

### **Macros**

- #define getfslx(val, id, flags)
- #define putfslx(val, id, flags)
- #define tgetfslx(val, id, flags)
- #define tputfslx(id, flags)
- #define getdfslx(val, var, flags)
- #define putdfslx(val, var, flags)
- #define tgetdfslx(val, var, flags)
- #define tputdfslx(var, flags)

### **Macro Definition Documentation**

### #define getfslx( val, id, flags )

Performs a get function on an input FSL of the MicroBlaze processor

#### **Parameters**

val	variable to sink data from get function
id	literal in the range of 0 to 7 (0 to 15 for MicroBlaze v7.00.a and later)
flags	valid FSL macro flags

### #define putfslx( val, id, flags )

Performs a put function on an input FSL of the MicroBlaze processor

#### **Parameters**

val	variable to source data to put function
id	literal in the range of 0 to 7 (0 to 15 for MicroBlaze v7.00.a and later)
flags	valid FSL macro flags

### #define tgetfslx( val, id, flags )

Performs a test get function on an input FSL of the MicroBlaze processor

#### **Parameters**

val	variable to sink data from get function
id	literal in the range of 0 to 7 (0 to 15 for MicroBlaze v7.00.a and later)
flags	valid FSL macro flags

### #define tputfslx( id, flags )

Performs a put function on an input FSL of the MicroBlaze processor

id	FSL identifier
flags	valid FSL macro flags

### #define getdfslx( val, var, flags )

Performs a getd function on an input FSL of the MicroBlaze processor

#### **Parameters**

val	variable to sink data from getd function
var	literal in the range of 0 to 7 (0 to 15 for MicroBlaze v7.00.a and later)
flags	valid FSL macro flags

### #define putdfslx( val, var, flags )

Performs a putd function on an input FSL of the MicroBlaze processor

#### **Parameters**

val	variable to source data to putd function
var	literal in the range of 0 to 7 (0 to 15 for MicroBlaze v7.00.a and later)
flags	valid FSL macro flags

### #define tgetdfslx( val, var, flags )

Performs a test getd function on an input FSL of the MicroBlaze processor;

#### **Parameters**

val	variable to sink data from getd function
var	literal in the range of 0 to 7 (0 to 15 for MicroBlaze v7.00.a and later)
flags	valid FSL macro flags

### #define tputdfslx( var, flags )

Performs a put function on an input FSL of the MicroBlaze processor

#### **Parameters**

var	FSL identifier
flags	valid FSL macro flags

### Microblaze PVR access routines and macros

### **Overview**

MicroBlaze processor v5.00.a and later versions have configurable Processor Version Registers (PVRs). The contents of the PVR are captured using the pvr\_t data structure, which is defined as an array of 32-bit words, with each word corresponding to a PVR register on hardware. The number of PVR words is determined by the number of PVRs configured in the hardware. You should not attempt to access PVR registers that are not present in hardware, as the pvr\_t data structure is resized to hold only as many PVRs as are present in hardware. To access information in the PVR:

- 1. Use the microblaze\_get\_pvr() function to populate the PVR data into a pvr\_t data structure.
- 2. In subsequent steps, you can use any one of the PVR access macros list to get individual data stored in the PVR.
- 3. pvr.h header file must be included to source to use PVR macros.

### **Macros**

- #define MICROBLAZE\_PVR\_IS\_FULL(\_pvr)
- #define MICROBLAZE\_PVR\_USE\_BARREL(\_pvr)
- #define MICROBLAZE\_PVR\_USE\_DIV(\_pvr)
- #define MICROBLAZE\_PVR\_USE\_HW\_MUL(\_pvr)
- #define MICROBLAZE\_PVR\_USE\_FPU(\_pvr)
- #define MICROBLAZE\_PVR\_USE\_ICACHE(\_pvr)
- #define MICROBLAZE\_PVR\_USE\_DCACHE(\_pvr)
- #define MICROBLAZE\_PVR\_MICROBLAZE\_VERSION(\_pvr)
- #define MICROBLAZE\_PVR\_USER1(\_pvr)
- #define MICROBLAZE\_PVR\_USER2(\_pvr)
- #define MICROBLAZE\_PVR\_D\_LMB(\_pvr)
- #define MICROBLAZE\_PVR\_D\_PLB(\_pvr)
- #define MICROBLAZE\_PVR\_I\_LMB(\_pvr)
- #define MICROBLAZE\_PVR\_I\_PLB(\_pvr)
- #define MICROBLAZE\_PVR\_INTERRUPT\_IS\_EDGE(\_pvr)
- #define MICROBLAZE\_PVR\_EDGE\_IS\_POSITIVE(\_pvr)
- #define MICROBLAZE\_PVR\_INTERCONNECT(\_pvr)
- #define MICROBLAZE\_PVR\_USE\_MUL64(\_pvr)
- #define MICROBLAZE\_PVR\_OPCODE\_0x0\_ILLEGAL(\_pvr)

- #define MICROBLAZE\_PVR\_UNALIGNED\_EXCEPTION(\_pvr)
- #define MICROBLAZE\_PVR\_ILL\_OPCODE\_EXCEPTION(\_pvr)
- #define MICROBLAZE\_PVR\_IPLB\_BUS\_EXCEPTION(\_pvr)
- #define MICROBLAZE\_PVR\_DPLB\_BUS\_EXCEPTION(\_pvr)
- #define MICROBLAZE\_PVR\_DIV\_ZERO\_EXCEPTION(\_pvr)
- #define MICROBLAZE\_PVR\_FPU\_EXCEPTION(\_pvr)
- #define MICROBLAZE\_PVR\_FSL\_EXCEPTION(\_pvr)
- #define MICROBLAZE\_PVR\_DEBUG\_ENABLED(\_pvr)
- #define MICROBLAZE\_PVR\_NUMBER\_OF\_PC\_BRK(\_pvr)
- #define MICROBLAZE\_PVR\_NUMBER\_OF\_RD\_ADDR\_BRK(\_pvr)
- #define MICROBLAZE\_PVR\_NUMBER\_OF\_WR\_ADDR\_BRK(\_pvr)
- #define MICROBLAZE\_PVR\_FSL\_LINKS(\_pvr)
- #define MICROBLAZE\_PVR\_ICACHE\_ADDR\_TAG\_BITS(\_pvr)
- #define MICROBLAZE\_PVR\_ICACHE\_ALLOW\_WR(\_pvr)
- #define MICROBLAZE\_PVR\_ICACHE\_LINE\_LEN(\_pvr)
- #define MICROBLAZE\_PVR\_ICACHE\_BYTE\_SIZE(\_pvr)
- #define MICROBLAZE\_PVR\_DCACHE\_ADDR\_TAG\_BITS(\_pvr)
- #define MICROBLAZE\_PVR\_DCACHE\_ALLOW\_WR(\_pvr)
- #define MICROBLAZE\_PVR\_DCACHE\_LINE\_LEN(\_pvr)
- #define MICROBLAZE\_PVR\_DCACHE\_BYTE\_SIZE(\_pvr)
- #define MICROBLAZE\_PVR\_ICACHE\_BASEADDR(\_pvr)
- #define MICROBLAZE\_PVR\_ICACHE\_HIGHADDR(\_pvr)
- #define MICROBLAZE\_PVR\_DCACHE\_BASEADDR(\_pvr)
- #define MICROBLAZE\_PVR\_DCACHE\_HIGHADDR(\_pvr)
- #define MICROBLAZE\_PVR\_TARGET\_FAMILY(\_pvr)
- #define MICROBLAZE\_PVR\_MSR\_RESET\_VALUE(\_pvr)
- #define MICROBLAZE\_PVR\_MMU\_TYPE(\_pvr)

### **Functions**

int microblaze\_get\_pvr (pvr\_t \*pvr)

### **Macro Definition Documentation**

### #define MICROBLAZE\_PVR\_IS\_FULL( \_pvr )

Return non-zero integer if PVR is of type FULL, 0 if basic

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_USE\_BARREL( \_pvr )

Return non-zero integer if hardware barrel shifter present.

#### **Parameters**

### #define MICROBLAZE\_PVR\_USE\_DIV( \_pvr )

Return non-zero integer if hardware divider present.

#### **Parameters**

_pvr
------

#### #define MICROBLAZE PVR USE HW MUL( \_pvr )

Return non-zero integer if hardware multiplier present.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_USE\_FPU( \_pvr )

Return non-zero integer if hardware floating point unit (FPU) present.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_USE\_ICACHE( $\_pvr$ )

Return non-zero integer if I-cache present.

_pvr pvr data structure	
-------------------------	--

### #define MICROBLAZE\_PVR\_USE\_DCACHE( \_pvr )

Return non-zero integer if D-cache present.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_MICROBLAZE\_VERSION( \_pvr )

Return MicroBlaze processor version encoding. Refer to the MicroBlaze Processor Reference Guide (UG081) for mappings from encodings to actual hardware versions.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_USER1( \_pvr )

Return the USER1 field stored in the PVR.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_USER2( \_pvr )

Return the USER2 field stored in the PVR.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE PVR D LMB( \_pvr )

Return non-zero integer if Data Side PLB interface is present.

_pvr	pvr data structure	
------	--------------------	--

### #define MICROBLAZE\_PVR\_D\_PLB( \_pvr )

Return non-zero integer if Data Side PLB interface is present.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_I\_LMB( \_pvr )

Return non-zero integer if Instruction Side Local Memory Bus (LMB) interface present.

#### **Parameters**

pvr	pvr data structure
<b>_P</b> *''	pvi data stractare

### #define MICROBLAZE\_PVR\_I\_PLB( \_pvr )

Return non-zero integer if Instruction Side PLB interface present.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_INTERRUPT\_IS\_EDGE( \_pvr )

Return non-zero integer if interrupts are configured as edge-triggered.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_EDGE\_IS\_POSITIVE( \_pvr )

Return non-zero integer if interrupts are configured as positive edge triggered.

_pvr	pvr data structure	
------	--------------------	--

### #define MICROBLAZE\_PVR\_INTERCONNECT( \_pvr )

Return non-zero if MicroBlaze processor has PLB interconnect; otherwise return zero.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_USE\_MUL64( \_pvr )

Return non-zero integer if MicroBlaze processor supports 64-bit products for multiplies.

#### **Parameters**

_pvr pvr data structure	
-------------------------	--

### #define MICROBLAZE\_PVR\_OPCODE\_0x0\_ILLEGAL( \_pvr )

Return non-zero integer if opcode 0x0 is treated as an illegal opcode. multiplies.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_UNALIGNED\_EXCEPTION( \_pvr )

Return non-zero integer if unaligned exceptions are supported.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_ILL\_OPCODE\_EXCEPTION( \_pvr )

Return non-zero integer if illegal opcode exceptions are supported.

_pvr	pvr data structure	
------	--------------------	--

### #define MICROBLAZE PVR IPLB BUS EXCEPTION( \_pvr )

Return non-zero integer if I-PLB exceptions are supported.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE PVR DPLB BUS EXCEPTION( \_pvr )

Return non-zero integer if I-PLB exceptions are supported.

#### **Parameters**

_pvr
------

### #define MICROBLAZE\_PVR\_DIV\_ZERO\_EXCEPTION( \_pvr )

Return non-zero integer if divide by zero exceptions are supported.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_FPU\_EXCEPTION( \_pvr )

Return non-zero integer if FPU exceptions are supported.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_FSL\_EXCEPTION( \_pvr )

Return non-zero integer if FSL exceptions are present.

_pvr	pvr data structure	
------	--------------------	--

### #define MICROBLAZE PVR DEBUG ENABLED( \_pvr )

Return non-zero integer if debug is enabled.

**Parameters** 

### #define MICROBLAZE\_PVR\_NUMBER\_OF\_PC\_BRK( \_pvr )

Return the number of hardware PC breakpoints available.

**Parameters** 

_pvr	pvr data structure
_ <del>_</del>	·

### #define MICROBLAZE\_PVR\_NUMBER\_OF\_RD\_ADDR\_BRK( \_pvr )

Return the number of read address hardware watchpoints supported.

**Parameters** 

_pvr	pvr data structure	
------	--------------------	--

### #define MICROBLAZE\_PVR\_NUMBER\_OF\_WR\_ADDR\_BRK( \_pvr )

Return the number of write address hardware watchpoints supported.

**Parameters** 

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_FSL\_LINKS( \_pvr )

Return the number of FSL links present.

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE PVR ICACHE ADDR TAG BITS( \_pvr )

Return the number of address tag bits for the I-cache.

#### **Parameters**

### #define MICROBLAZE\_PVR\_ICACHE\_ALLOW\_WR( \_pvr )

Return non-zero if writes to I-caches are allowed.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_ICACHE\_LINE\_LEN( \_pvr )

Return the length of each I-cache line in bytes.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_ICACHE\_BYTE\_SIZE( \_pvr )

Return the size of the D-cache in bytes.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_DCACHE\_ADDR\_TAG\_BITS( \_pvr )

Return the number of address tag bits for the D-cache.

_pvr	pvr data structure	
------	--------------------	--

### #define MICROBLAZE PVR DCACHE ALLOW WR( \_pvr )

Return non-zero if writes to D-cache are allowed.

**Parameters** 

_pvr
------

### #define MICROBLAZE\_PVR\_DCACHE\_LINE\_LEN( \_pvr )

Return the length of each line in the D-cache in bytes.

#### **Parameters**

_pvr pvr data structure	
-------------------------	--

### #define MICROBLAZE\_PVR\_DCACHE\_BYTE\_SIZE( \_pvr )

Return the size of the D-cache in bytes.

#### **Parameters**

_pvr pvr data structure	
-------------------------	--

### #define MICROBLAZE\_PVR\_ICACHE\_BASEADDR( \_pvr )

Return the base address of the I-cache.

#### **Parameters**

_pvr	pvr data structure
------	--------------------

### #define MICROBLAZE\_PVR\_ICACHE\_HIGHADDR( \_pvr )

Return the high address of the I-cache.

pvr	pvr data structure
_PV1	pvi data siructure

### #define MICROBLAZE\_PVR\_DCACHE\_BASEADDR( \_pvr )

Return the base address of the D-cache.

#### **Parameters**

_pvr	pvr data structure	
------	--------------------	--

### #define MICROBLAZE\_PVR\_DCACHE\_HIGHADDR( \_pvr )

Return the high address of the D-cache.

#### **Parameters**

_pvr	pvr data structure	
------	--------------------	--

### #define MICROBLAZE\_PVR\_TARGET\_FAMILY( \_pvr )

Return the encoded target family identifier.

#### **Parameters**

_ <i>pvr</i> pvr data structure	
---------------------------------	--

### #define MICROBLAZE\_PVR\_MSR\_RESET\_VALUE( \_pvr )

Refer to the MicroBlaze Processor Reference Guide (UG081) for mappings from encodings to target family name strings.

-		
-[		
-		
-	nvr	
- 1	_P*'	
- 1		

### int microblaze\_get\_pvr ( pvr\_t \* pvr )

Populate the PVR data structure to which pvr points with the values of the hardware PVR registers.

#### **Parameters**

pvr-	address of PVR data structure to be populated
------	---

#### **Returns**

0 - SUCCESS -1 - FAILURE

# **Sleep Routines for Microblaze**

### **Overview**

microblaze\_sleep.h contains microblaze sleep APIs. These APIs provides delay for requested duration.

#### Note

microblaze\_sleep.h may contain architecture-dependent items.

### **Functions**

void MB\_Sleep (u32 MilliSeconds) \_\_attribute\_\_((\_\_deprecated\_\_))

### **Function Documentation**

### void MB\_Sleep ( u32 MilliSeconds )

Provides delay for requested duration..

#### **Parameters**

MilliSeconds-	Delay time in milliseconds.
---------------	-----------------------------

#### **Returns**

None.

#### Note

Instruction cache should be enabled for this to work.

# Chapter 3

# Cortex R5 Processor API

### **Overview**

Standalone BSP contains boot code, cache, exception handling, file and memory management, configuration, time and processor-specific include functions. It supports gcc compiler. This section provides a linked summary and detailed descriptions of the Cortex R5 processor APIs.

### **Modules**

- Cortex R5 Processor Boot Code
- Cortex R5 Processor MPU specific APIs
- Cortex R5 Processor Cache Functions
- Cortex R5 Time Functions
- Cortex R5 Event Counters Functions
- Cortex R5 Processor Specific Include Files

### **Cortex R5 Processor Boot Code**

### **Overview**

The boot. S file contains a minimal set of code for transferring control from the processor's reset location to the start of the application. The boot code performs minimum configuration which is required for an application to run starting from processor's reset state. Below is a sequence illustrating what all configuration is performed before control reaches to main function.

- 1. Program vector table base for exception handling
- 2. Program stack pointer for various modes (IRQ, FIQ, supervisor, undefine, abort, system)
- 3. Disable instruction cache, data cache and MPU
- 4. Invalidate instruction and data cache
- 5. Configure MPU with short descriptor translation table format and program base address of translation table
- 6. Enable data cache, instruction cache and MPU

- 7. Enable Floating point unit
- 8. Transfer control to \_start which clears BSS sections and jumping to main application

# **Cortex R5 Processor MPU specific APIs**

### **Overview**

MPU functions provides access to MPU operations such as enable MPU, disable MPU and set attribute for section of memory. Boot code invokes Init\_MPU function to configure the MPU. A total of 10 MPU regions are allocated with another 6 being free for users. Overview of the memory attributes for different MPU regions is as given below,

	Memory Range	Attributes of MPURegion	Note
DDR	0x00000000 - 0x7FFFFFFF	Normal write-back Cacheable	For a system where DDR is less than 2GB, region after DDR and before PL is marked as undefined in translation table
PL	0x80000000 - 0xBFFFFFF	Strongly Ordered	
QSPI	0xC0000000 - 0xDFFFFFF	Device Memory	
PCle	0xE0000000 - 0xEFFFFFF	Device Memory	
STM_CORESIGHT	0xF8000000 - 0xF8FFFFFF	Device Memory	

	Memory Range	Attributes of MPURegion	Note
RPU_R5_GIC	0xF9000000 - 0xF90FFFFF	Device Memory	
FPS	0xFD000000 - 0xFDFFFFFF	Device Memory	
LPS	0xFE000000 - 0xFFFFFFFF	Device Memory	0xFE000000 - 0xFEFFFFFF upper LPS slaves, 0xFF000000 - 0xFFFFFFFF lower LPS slaves
ОСМ	0xFFFC0000 - 0xFFFFFFF	Normal write-back Cacheable	

### **Functions**

- void Xil\_SetTlbAttributes (INTPTR Addr, u32 attrib)
- void Xil\_EnableMPU (void)
- void Xil\_DisableMPU (void)
- void Xil\_SetMPURegion (INTPTR addr, u64 size, u32 attrib)

# **Function Documentation**

### void Xil\_SetTlbAttributes ( INTPTR addr, u32 attrib )

This function sets the memory attributes for a section covering 1MB, of memory in the translation table.

#### **Parameters**

Addr	32-bit address for which memory attributes need to be set.
attrib	Attribute for the given memory region.

#### **Returns**

None.

### void Xil\_EnableMPU ( void )

Enable MPU for Cortex R5 processor. This function invalidates I cache and flush the D Caches, and then enables the MPU.

#### **Parameters**

None.	

#### **Returns**

None.

### void Xil\_DisableMPU ( void )

Disable MPU for Cortex R5 processors. This function invalidates I cache and flush the D Caches, and then disabes the MPU.

#### **Parameters**

None.	
-------	--

#### Returns

None.

### void Xil\_SetMPURegion ( INTPTR addr, u64 size, u32 attrib )

Set the memory attributes for a section of memory in the translation table.

#### **Parameters**

Addr	32-bit address for which memory attributes need to be set	
size	size is the size of the region.	
attrib	Attribute for the given memory region.	

#### **Returns**

None.

## **Cortex R5 Processor Cache Functions**

### **Overview**

Cache functions provide access to cache related operations such as flush and invalidate for instruction and data caches. It gives option to perform the cache operations on a single cacheline, a range of memory and an entire cache.

### **Functions**

- void Xil\_DCacheEnable (void)
- void Xil\_DCacheDisable (void)
- void Xil\_DCacheInvalidate (void)
- void Xil\_DCacheInvalidateRange (INTPTR adr, u32 len)
- void Xil\_DCacheFlush (void)
- void Xil\_DCacheFlushRange (INTPTR adr, u32 len)
- void Xil\_DCacheInvalidateLine (INTPTR adr)
- void Xil\_DCacheFlushLine (INTPTR adr)
- void Xil\_DCacheStoreLine (INTPTR adr)
- void Xil\_ICacheEnable (void)
- void Xil\_ICacheDisable (void)
- void Xil\_ICacheInvalidate (void)
- void Xil\_ICacheInvalidateRange (INTPTR adr, u32 len)
- void Xil\_ICacheInvalidateLine (INTPTR adr)

### **Function Documentation**

### void Xil\_DCacheEnable ( void )

Enable the Data cache.

Par	am	ete	rs
-----	----	-----	----

N	one.	

#### Returns

None.

#### Note

None.

### void Xil\_DCacheDisable ( void )

Disable the Data cache.

#### **Parameters**

-		
	None	
	INOTIC.	

#### **Returns**

None.

#### Note

None.

### void Xil\_DCacheInvalidate ( void )

Invalidate the entire Data cache.

#### **Parameters**

None.	
-------	--

#### **Returns**

None.

### void Xil\_DCacheInvalidateRange ( INTPTR adr, u32 len )

Invalidate the Data cache for the given address range. If the bytes specified by the address (adr) are cached by the Data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the modified contents are lost and are NOT written to system memory before the line is invalidated.

#### **Parameters**

adr	32bit start address of the range to be invalidated.
len	Length of range to be invalidated in bytes.

#### **Returns**

None.

### void Xil\_DCacheFlush ( void )

Flush the entire Data cache.

#### **Parameters**

None.				
-------	--	--	--	--

#### **Returns**

None.

### void Xil\_DCacheFlushRange ( INTPTR adr, u32 len )

Flush the Data cache for the given address range. If the bytes specified by the address (adr) are cached by the Data cache, the cacheline containing those bytes is invalidated. If the cacheline is modified (dirty), the written to system memory before the lines are invalidated.

#### **Parameters**

adr	32bit start address of the range to be flushed.
len	Length of the range to be flushed in bytes

#### Returns

None.

### void Xil DCachelnvalidateLine (INTPTR adr)

Invalidate a Data cache line. If the byte specified by the address (adr) is cached by the data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the modified contents are lost and are NOT written to system memory before the line is invalidated.

#### **Parameters**

adr	32bit address of the data to be flushed.
-----	--

#### **Returns**

None.

#### Note

The bottom 4 bits are set to 0, forced by architecture.

### void Xil\_DCacheFlushLine ( INTPTR adr )

Flush a Data cache line. If the byte specified by the address (adr) is cached by the Data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the entire contents of the cacheline are written to system memory before the line is invalidated.

#### **Parameters**

adr	32bit address of the data to be flushed.
-----	--

#### Returns

None.

#### Note

The bottom 4 bits are set to 0, forced by architecture.

Send Feedback

### void Xil\_DCacheStoreLine ( INTPTR adr )

Store a Data cache line. If the byte specified by the address (adr) is cached by the Data cache and the cacheline is modified (dirty), the entire contents of the cacheline are written to system memory. After the store completes, the cacheline is marked as unmodified (not dirty).

Parameters	
adr	32bit address of the data to be stored
Returns	
None.	
Note	
The bottom 4 bits are se	t to 0, forced by architecture.
void Xil_lCacheEnable	e (void)
Enable the instruction cache.	
Parameters	
None.	
Returns	
None.	
void Xil_ICacheDisabl	e ( void )
Disable the instruction cache.	
Parameters	
None.	

### Returns

None.

### void Xil\_ICacheInvalidate ( void )

Invalidate the entire instruction cache.

#### **Parameters**

	None.		
--	-------	--	--

#### Returns

None.

### void Xil\_ICacheInvalidateRange ( INTPTR adr, u32 len )

Invalidate the instruction cache for the given address range. If the bytes specified by the address (adr) are cached by the Data cache, the cacheline containing that byte is invalidated. If the cachelineis modified (dirty), the modified contents are lost and are NOT written to system memory before the line is invalidated.

#### **Parameters**

adr	32bit start address of the range to be invalidated.
len	Length of the range to be invalidated in bytes.

#### **Returns**

None.

### void Xil\_ICacheInvalidateLine ( INTPTR adr )

Invalidate an instruction cache line. If the instruction specified by the address is cached by the instruction cache, the cacheline containing that instruction is invalidated.

#### **Parameters**

ad	dr	32bit address of the instruction to be invalidated.
----	----	---

#### Returns

None.

#### Note

The bottom 4 bits are set to 0, forced by architecture.

### **Cortex R5 Time Functions**

### **Overview**

The xtime\_l.c file and corresponding xtime\_l.h include file provide access to the 32-bit counter in TTC. The sleep.c, usleep.c file and the corresponding sleep.h include file implement sleep functions. Sleep functions are implemented as busy loops.

### **Functions**

- void XTime\_StartTimer (void)
- void XTime\_SetTime (XTime Xtime\_Global)
- void XTime\_GetTime (XTime \*Xtime\_Global)

### **Function Documentation**

### void XTime\_StartTimer ( void )

Starts the TTC timer 3 counter 0 if present and if it is not already running with desired parameters for sleep functionalities.

#### **Parameters**

None.	
-------	--

#### **Returns**

None.

#### Note

When this function is called by any one processor in a multi- processor environment, reference time will reset/lost for all processors.

### void XTime SetTime ( XTime Xtime\_Global )

TTC Timer runs continuously and the time can not be set as desired. This API doesn't contain anything. It is defined to have uniformity across platforms.

#### **Parameters**

Xtime_Global	32 bit value to be written to the timer counter register.
--------------	---

#### Returns

None.

#### Note

In multiprocessor environment reference time will reset/lost for all processors, when this function called by any one processor.

### void XTime\_GetTime ( XTime \* Xtime\_Global )

Get the time from the timer counter register.

#### **Parameters**

Xtime_Global	Pointer to the 32 bit location to be updated with the time current value of timer
	counter register.

#### **Returns**

None.

### **Cortex R5 Event Counters Functions**

### **Overview**

Cortex R5 event counter functions can be utilized to configure and control the Cortex-R5 performance monitor events. Cortex-R5 Performance Monitor has 6 event counters which can be used to count a variety of events described in Coretx-R5 TRM. xpm\_counter.h defines configurations XPM\_CNTRCFGx which can be used to program the event counters to count a set of events.

#### Note

It doesn't handle the Cortex-R5 cycle counter, as the cycle counter is being used for time keeping.

### **Functions**

- void Xpm\_SetEvents (s32 PmcrCfg)
- void Xpm\_GetEventCounters (u32 \*PmCtrValue)

Send Feedback

### **Function Documentation**

### void Xpm\_SetEvents ( s32 PmcrCfg )

This function configures the Cortex R5 event counters controller, with the event codes, in a configuration selected by the user and enables the counters.

#### **Parameters**

PmcrCfg	Configuration	value	based	on	which	the	event	counte	rs	are
	configured.XPN				defined	d in	xpm_co	unter.h	can	be
	utilized for setti	ng confi	guration							

#### **Returns**

None.

### void Xpm\_GetEventCounters ( u32 \* PmCtrValue )

This function disables the event counters and returns the counter values.

#### **Parameters**

PmCtrValue	Pointer to an array of type u32 PmCtrValue[6]. It is an output parameter which is used to return the PM counter values.
	is used to retain the Fivi counter values.

#### **Returns**

None.

# **Cortex R5 Processor Specific Include Files**

### **Overview**

The xpseudo\_asm.h file includes xreg\_cortexr5.h and xpseudo\_asm\_gcc.h.

The xreg\_cortexr5.h include file contains the register numbers and the register bits for the ARM Cortex-R5 processor.

The xpseudo\_asm\_gcc.h file contains the definitions for the most often used inline assembler instructions, available as macros. These can be very useful for tasks such as setting or getting special purpose registers, synchronization, or cache manipulation. These inline assembler instructions can be used from drivers and user applications written in C.

# Chapter 4

# ARM Processor Common API

### **Overview**

This section provides a linked summary and detailed descriptions of the ARM Processor Common APIs.

### **Modules**

ARM Processor Exception Handling

# **ARM Processor Exception Handling**

### **Overview**

ARM processors specific exception related APIs for cortex A53,A9 and R5 can utilized for enabling/disabling IRQ, registering/removing handler for exceptions or initializing exception vector table with null handler.

### **Macros**

- #define Xil\_ExceptionEnableMask(Mask)
- #define Xil\_ExceptionEnable()
- #define Xil\_ExceptionDisableMask(Mask)
- #define Xil\_ExceptionDisable()
- #define Xil\_EnableNestedInterrupts()
- #define Xil\_DisableNestedInterrupts()

## **Typedefs**

typedef void(\* Xil\_ExceptionHandler) (void \*data)

### **Functions**

- void Xil\_ExceptionRegisterHandler (u32 Exception\_id, Xil\_ExceptionHandler Handler, void \*Data)
- void Xil\_ExceptionRemoveHandler (u32 Exception\_id)

- void Xil\_ExceptionInit (void)
- void Xil\_DataAbortHandler (void \*CallBackRef)
- void Xil\_PrefetchAbortHandler (void \*CallBackRef)
- void Xil\_UndefinedExceptionHandler (void \*CallBackRef)

### **Macro Definition Documentation**

### #define Xil\_ExceptionEnableMask( Mask )

Enable Exceptions.

#### **Parameters**

Mask	for exceptions to be enabled.

#### **Returns**

None.

#### Note

If bit is 0, exception is enabled. C-Style signature: void Xil\_ExceptionEnableMask(Mask)

### #define Xil\_ExceptionEnable( )

Enable the IRQ exception.

#### **Returns**

None.

#### Note

None.

### #define Xil\_ExceptionDisableMask( Mask )

Disable Exceptions.

#### **Parameters**

Mask	for exceptions to be enabled.
------	-------------------------------

#### Returns

None.

#### Note

If bit is 1, exception is disabled. C-Style signature: Xil\_ExceptionDisableMask(Mask)

Send Feedback

### #define Xil\_ExceptionDisable( )

Disable the IRQ exception.

#### **Returns**

None.

#### Note

None.

### #define Xil\_EnableNestedInterrupts( )

Enable nested interrupts by clearing the I and F bits in CPSR. This API is defined for cortex-a9 and cortex-r5.

#### **Returns**

None.

#### Note

This macro is supposed to be used from interrupt handlers. In the interrupt handler the interrupts are disabled by default (I and F are 1). To allow nesting of interrupts, this macro should be used. It clears the I and F bits by changing the ARM mode to system mode. Once these bits are cleared and provided the preemption of interrupt conditions are met in the GIC, nesting of interrupts will start happening. Caution: This macro must be used with caution. Before calling this macro, the user must ensure that the source of the current IRQ is appropriately cleared. Otherwise, as soon as we clear the I and F bits, there can be an infinite loop of interrupts with an eventual crash (all the stack space getting consumed).

### #define Xil\_DisableNestedInterrupts( )

Disable the nested interrupts by setting the I and F bits. This API is defined for cortex-a9 and cortex-r5.

#### **Returns**

None.

#### Note

This macro is meant to be called in the interrupt service routines. This macro cannot be used independently. It can only be used when nesting of interrupts have been enabled by using the macro Xil\_EnableNestedInterrupts(). In a typical flow, the user first calls the Xil\_EnableNestedInterrupts in the ISR at the appropriate point. The user then must call this macro before exiting the interrupt service routine. This macro puts the ARM back in IRQ/FIQ mode and hence sets back the I and F bits.

### Typedef Documentation

### typedef void(\* Xil\_ExceptionHandler) (void \*data)

This typedef is the exception handler function.

### **Function Documentation**

# void Xil\_ExceptionRegisterHandler ( u32 Exception\_id, Xil\_ExceptionHandler Handler, void \* Data )

Register a handler for a specific exception. This handler is being called when the processor encounters the specified exception.

#### **Parameters**

exception_id	contains the ID of the exception source and should be in the range of 0 to XIL_EXCEPTION_ID_LAST. See xil_exception.h for further information.
Handler	to the Handler for that exception.
Data	is a reference to Data that will be passed to the Handler when it gets called.

п	~4.		-	_
ĸ		ır	n	•

None.

#### Note

None.

### void Xil ExceptionRemoveHandler ( u32 Exception\_id )

Removes the Handler for a specific exception Id. The stub Handler is then registered for this exception Id.

#### **Parameters**

exception_id	contains the ID of the exception source and should be in the range of 0 to
	XIL_EXCEPTION_ID_LAST. See xil_exception.h for further information.

#### Returns

None.

#### Note

None.

### void Xil\_ExceptionInit ( void )

The function is a common API used to initialize exception handlers across all supported arm processors. For ARM Cortex-A53, Cortex-R5, and Cortex-A9, the exception handlers are being initialized statically and this function does not do anything. However, it is still present to take care of backward compatibility issues (in earlier versions of BSPs, this API was being used to initialize exception handlers).

Parameters	
None.	
Returns	
None.	
Note	
None.	
void Xil_DataAbortHa	andler ( void * CallBackRef )
Default Data abort handler who be acquired	nich prints data fault status register through which information about data fault can
Parameters	
None	
Returns	
None.	
Note	
None.	
void Xil_PrefetchAbo	rtHandler ( void * CallBackRef )
Default Prefetch abort hand instruction prefetch fault can	ler which prints prefetch fault status register through which information about be acquired
Parameters	
None	
Returns	
None.	
Note	
None.	

### void Xil\_UndefinedExceptionHandler ( void \* CallBackRef )

Default undefined exception handler which prints address of the undefined instruction if debug prints are enabled

# None None

#### **Returns**

None.

#### Note

None.

# Chapter 5

# Cortex A9 Processor API

### **Overview**

Standalone BSP contains boot code, cache, exception handling, file and memory management, configuration, time and processor-specific include functions. It supports gcc compilers.

### **Modules**

- Cortex A9 Processor Boot Code
- Cortex A9 Processor Cache Functions
- Cortex A9 Processor MMU Functions
- Cortex A9 Time Functions
- Cortex A9 Event Counter Function
- PL310 L2 Event Counters Functions
- Cortex A9 Processor and pl310 Errata Support
- Cortex A9 Processor Specific Include Files

### **Cortex A9 Processor Boot Code**

### **Overview**

The boot. S file contains a minimal set of code for transferring control from the processor reset location to the start of the application. The boot code performs minimum configuration which is required for an application to run starting from processor's reset state. Below is a sequence illustrating what all configuration is performed before control reaches to main function.

- 1. Program vector table base for exception handling
- 2. Invalidate instruction cache, data cache and TLBs
- 3. Program stack pointer for various modes (IRQ, FIQ, supervisor, undefine, abort, system)
- 4. Configure MMU with short descriptor translation table format and program base address of translation table
- 5. Enable data cache, instruction cache and MMU

- 6. Enable Floating point unit
- 7. Transfer control to \_start which clears BSS sections, initializes global timer and runs global constructor before jumping to main application

The translation\_table.S file contains a static page table required by MMU for cortex-A9. This translation table is flat mapped (input address = output address) with default memory attributes defined for zynq architecture. It utilizes short descriptor translation table format with each section defining 1MB of memory. The overview of translation table memory attributes is described below.

	Memory Range	Definition in Translation Table	Note
DDR	0x00000000 - 0x3FFFFFFF	Normal write-back Cacheable	For a system where DDR is less than 1GB, region after DDR and before PL is marked as undefined/reserved in translation table
PL	0x40000000 - 0xBFFFFFF	Strongly Ordered	
Reserved	0xC0000000 - 0xDFFFFFF	Unassigned	
Memory mapped devices	0xE0000000 - 0xE02FFFFF	Device Memory	
Reserved	0xE0300000 - 0xE0FFFFFF	Unassigned	
NAND, NOR	0xE1000000 - 0xE3FFFFFF	Device memory	
SRAM	0xE4000000 - 0xE5FFFFFF	Normal write-back Cacheable	
Reserved	0xE6000000 - 0xF7FFFFF	Unassigned	
AMBA APB Peripherals	0xF8000000 - 0xF8FFFFF	Device Memory	0xF8000C00 - 0xF8000FFF, 0xF8010000 -0xF88FFFFF and 0xF8F03000 to 0xF8FFFFFF are reserved but due to granual size of 1MB, it is not possible to define separate regions for them

	Memory Range	Definition in Translation Table	Note
Reserved	0xF9000000 - 0xFBFFFFF	Unassigned	
Linear QSPI - XIP	0xFC000000 - 0xFDFFFFFF	Normal write-through cacheable	
Reserved	0xFE000000 - 0xFFEFFFFF	Unassigned	
ОСМ	0xFFF00000 - 0xFFFFFFF	Normal inner write-back cacheable	0xFFF00000 to 0xFFFB0000 is reserved but due to 1MB granual size, it is not possible to define separate region for it

# **Cortex A9 Processor Cache Functions**

## **Overview**

Cache functions provide access to cache related operations such as flush and invalidate for instruction and data caches. It gives option to perform the cache operations on a single cacheline, a range of memory and an entire cache.

# **Functions**

- void Xil\_DCacheEnable (void)
- void Xil\_DCacheDisable (void)

- void Xil\_L2CacheFlushRange (u32 adr, u32 len)
- void Xil\_L2CacheStoreLine (u32 adr)

## **Function Documentation**

## void Xil DCacheEnable (void)

Enable the Data cache.

### **Parameters**

Non	е.	

### Returns

None.

### Note

### void Xil\_DCacheDisable ( void )

Disable the Data cache.

Parameters			
None.			
Returns			
None.			
Note			
None.			
void Xil_DCacheInvalidate ( void ) Invalidate the entire Data cache.			
Invalidate the entire Data cach			
Invalidate the entire Data cach  Parameters			
Invalidate the entire Data cach  Parameters  None.			
Invalidate the entire Data cach  Parameters  None.  Returns			

# void Xil\_DCacheInvalidateRange ( INTPTR adr, u32 len )

Invalidate the Data cache for the given address range. If the bytes specified by the address range are cached by the Data cache, the cachelines containing those bytes are invalidated. If the cachelines are modified (dirty), the modified contents are lost and NOT written to the system memory before the lines are invalidated. In this function, if start address or end address is not aligned to cache-line, particular cache-line containing unaligned start or end address is flush first and then invalidated the others as invalidating the same unaligned cache line may result into loss of data. This issue raises few possibilities.

If the address to be invalidated is not cache-line aligned, the following choices are available:

- 1. Invalidate the cache line when required and do not bother much for the side effects. Though it sounds good, it can result in hard-to-debug issues. The problem is, if some other variable are allocated in the same cache line and had been recently updated (in cache), the invalidation would result in loss of data.
- 2. Flush the cache line first. This will ensure that if any other variable present in the same cache line and updated recently are flushed out to memory. Then it can safely be invalidated. Again it sounds good, but this can result in issues. For example, when the invalidation happens in a typical ISR (after a DMA transfer has updated the memory), then flushing the cache line means, loosing data that were updated recently before the ISR got invoked.

Send Feedback

Linux prefers the second one. To have uniform implementation (across standalone and Linux), the second option is implemented. This being the case, following needs to be taken care of:

- 1. Whenever possible, the addresses must be cache line aligned. Please nore that, not just start address, even the end address must be cache line aligned. If that is taken care of, this will always work.
- 2. Avoid situations where invalidation has to be done after the data is updated by peripheral/DMA directly into the memory. It is not tough to achieve (may be a bit risky). The common use case to do invalidation is when a DMA happens. Generally for such use cases, buffers can be allocated first and then start the DMA. The practice that needs to be followed here is, immediately after buffer allocation and before starting the DMA, do the invalidation. With this approach, invalidation need not to be done after the DMA transfer is over.

This is going to always work if done carefully. However, the concern is, there is no guarantee that invalidate has not needed to be done after DMA is complete. For example, because of some reasons if the first cache line or last cache line (assuming the buffer in question comprises of multiple cache lines) are brought into cache (between the time it is invalidated and DMA completes) because of some speculative prefetching or reading data for a variable present in the same cache line, then we will have to invalidate the cache after DMA is complete.

### **Parameters**

adr	32bit start address of the range to be invalidated.
len	Length of the range to be invalidated in bytes.

D	٥ŧ٠		
к	en	ırı	ns

None.

### Note

None.

## void Xil\_DCacheFlush ( void )

Flush the entire Data cache.

### **Parameters**

l Nia	20	
I INC	ne.	
	1101	

### Returns

None.

### Note

## void Xil\_DCacheFlushRange ( INTPTR adr, u32 len )

Flush the Data cache for the given address range. If the bytes specified by the address range are cached by the data cache, the cachelines containing those bytes are invalidated. If the cachelines are modified (dirty), they are written to the system memory before the lines are invalidated.

### **Parameters**

adr	32bit start address of the range to be flushed.
len	Length of the range to be flushed in bytes.

D	~+			_
ĸ	et	ш	'n	S

None.

### Note

None.

## void Xil\_ICacheEnable ( void )

Enable the instruction cache.

### **Parameters**

None.	
-------	--

### **Returns**

None.

### Note

None.

## void Xil\_ICacheDisable ( void )

Disable the instruction cache.

### **Parameters**

Mana	
None	
140110.	
1.01.01	

### **Returns**

None.

### Note

## void Xil\_ICacheInvalidate ( void )

Invalidate the entire instruction cache.

### **Parameters**

None.

# validateRange(INTPTR adr, u32 len)

cache for the given address range. If the instructions specified by the address range cache, the cachelines containing those instructions are invalidated.

adr

len Length of the range to a

### **Returns**

None.

None

### uoz adr )

. If the byte specified by the address (adr) is cached by the Data cache, the

f the data to be flushed.

### Returns

None.

### Note

The bottom 4 bits are set to 0, forced by architecture.

**Standalone v7.0** UG647 May 15, 2019 www.xilinx.com

### void Xil\_DCacheFlushLine ( u32 adr )

Flush a Data cache line. If the byte specified by the address (adr) is cached by the Data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the entire contents of the cacheline are written to system memory before the line is invalidated.

### **Parameters**

adr 32bit address of the data to be flushed.	
--	--

### Returns

None.

### Note

The bottom 4 bits are set to 0, forced by architecture.

## void Xil\_DCacheStoreLine ( u32 adr )

Store a Data cache line. If the byte specified by the address (adr) is cached by the Data cache and the cacheline is modified (dirty), the entire contents of the cacheline are written to system memory. After the store completes, the cacheline is marked as unmodified (not dirty).

### **Parameters**

adr	32bit address of the data to be stored.
-----	---

### Returns

None.

#### Note

The bottom 4 bits are set to 0, forced by architecture.

# void Xil\_ICacheInvalidateLine ( u32 adr )

Invalidate an instruction cache line. If the instruction specified by the address is cached by the instruction cache, the cacheline containing that instruction is invalidated.

### **Parameters**

adr	32bit address of the instruction to be invalidated.
-----	---

#### Returns

None.

### Note

The bottom 4 bits are set to 0, forced by architecture.

Send Feedback

# void Xil\_L1DCacheEnable ( void )

Enable the level 1 Data cache.

Parameters		
None.		
Returns		
None.		
Note		
None.		
void Xil_L1DCacheDis		
Parameters		
None.		
Returns None.		
Note		
None.		
void Xil_L1DCacheInvalidate(void)		
Invalidate the level 1 Data cache.		
Parameters		
None.		

### Returns

None.

### Note

In Cortex A9, there is no cp instruction for invalidating the whole D-cache. This function invalidates each line by set/way.

## void Xil\_L1DCacheInvalidateLine ( u32 adr )

Invalidate a level 1 Data cache line. If the byte specified by the address (Addr) is cached by the Data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the modified contents are lost and are NOT written to system memory before the line is invalidated.

### **Parameters**

adr	32	bit address of the data to be invalidated.
-----	----	--

### Returns

None.

### Note

The bottom 5 bits are set to 0, forced by architecture.

## void Xil\_L1DCacheInvalidateRange ( u32 adr, u32 len )

Invalidate the level 1 Data cache for the given address range. If the bytes specified by the address range are cached by the Data cache, the cachelines containing those bytes are invalidated. If the cachelines are modified (dirty), the modified contents are lost and NOT written to the system memory before the lines are invalidated.

### **Parameters**

adr	32bit start address of the range to be invalidated.
len	Length of the range to be invalidated in bytes.

#### **Returns**

None.

### Note

None.

# void Xil\_L1DCacheFlush (void)

Flush the level 1 Data cache.

### **Parameters**

None.	

### Returns

### Note

In Cortex A9, there is no cp instruction for flushing the whole D-cache. Need to flush each line.

## void Xil\_L1DCacheFlushLine ( u32 adr )

Flush a level 1 Data cache line. If the byte specified by the address (adr) is cached by the Data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the entire contents of the cacheline are written to system memory before the line is invalidated.

### **Parameters**

adr	32bit address of the data to be flushed.
-----	--

### Returns

None.

### Note

The bottom 5 bits are set to 0, forced by architecture.

## void Xil\_L1DCacheFlushRange ( u32 adr, u32 len )

Flush the level 1 Data cache for the given address range. If the bytes specified by the address range are cached by the Data cache, the cacheline containing those bytes are invalidated. If the cachelines are modified (dirty), they are written to system memory before the lines are invalidated.

### **Parameters**

adr	32bit start address of the range to be flushed.
len	Length of the range to be flushed in bytes.

### Returns

None.

### Note

# void Xil\_L1DCacheStoreLine ( u32 adr )

Store a level 1 Data cache line. If the byte specified by the address (adr) is cached by the Data cache and the cacheline is modified (dirty), the entire contents of the cacheline are written to system memory. After the store completes, the cacheline is marked as unmodified (not dirty).

Parameters	
Address	to be stored.
Returns	
None.	
Note	
The bottom 5 bi	ts are set to 0, forced by architecture.
void Xil L1ICac	heEnable(void)
Enable the level 1 ins	
Parameters	
None.	
Returns	
None.	
Note	
None.	
void Xil L1lCac	heDisable(void)
Disable level 1 the ins	
Parameters	
None.	
Returns	
None.	

Send Feedback

None.

Note

## void Xil\_L1lCacheInvalidate ( void )

Invalidate the entire level 1 instruction cache.

### **Parameters**

٨	lone.		
---	-------	--	--

### **Returns**

None.

### Note

None.

## void Xil\_L1lCacheInvalidateLine ( u32 adr )

Invalidate a level 1 instruction cache line. If the instruction specified by the address is cached by the instruction cache, the cacheline containing that instruction is invalidated.

### **Parameters**

adr	32bit address of the instruction to be invalidated.
-----	---

### **Returns**

None.

### Note

The bottom 5 bits are set to 0, forced by architecture.

# void Xil\_L1lCacheInvalidateRange ( u32 adr, u32 len )

Invalidate the level 1 instruction cache for the given address range. If the instructions specified by the address range are cached by the instruction cache, the cacheline containing those bytes are invalidated.

### **Parameters**

adr	32bit start address of the range to be invalidated.
len	Length of the range to be invalidated in bytes.

### Returns

None.

### Note

# void Xil\_L2CacheEnable ( void )

Enable the L2 cache.	
----------------------	--

<b>Parameters</b>	
-------------------	--

Non	e.				
-----	----	--	--	--	--

### Returns

None.

### Note

None.

## void Xil\_L2CacheDisable ( void )

Disable the L2 cache.

### **Parameters**

### Returns

None.

### Note

None.

# void Xil\_L2CacheInvalidate ( void )

Invalidate the entire level 2 cache.

### **Parameters**

None.	

### Returns

None.

### Note

### void Xil\_L2CacheInvalidateLine ( u32 adr )

Invalidate a level 2 cache line. If the byte specified by the address (adr) is cached by the Data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the modified contents are lost and are NOT written to system memory before the line is invalidated.

### **Parameters**

adr	32bit address of the data/instruction to be invalidated.
-----	--

### Returns

None.

### Note

The bottom 4 bits are set to 0, forced by architecture.

## void Xil\_L2CacheInvalidateRange ( u32 adr, u32 len )

Invalidate the level 2 cache for the given address range. If the bytes specified by the address range are cached by the L2 cache, the cacheline containing those bytes are invalidated. If the cachelines are modified (dirty), the modified contents are lost and are NOT written to system memory before the lines are invalidated.

### **Parameters**

adr	32bit start address of the range to be invalidated.
len	Length of the range to be invalidated in bytes.

#### **Returns**

None.

### Note

None.

# void Xil\_L2CacheFlush (void)

Flush the entire level 2 cache.

### **Parameters**

None	
None.	

### Returns

### Note

None.

## void Xil\_L2CacheFlushLine ( u32 adr )

Flush a level 2 cache line. If the byte specified by the address (adr) is cached by the L2 cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the entire contents of the cacheline are written to system memory before the line is invalidated.

### **Parameters**

adr		32bit address of the data/instruction to be flushed.
-----	--	--

### Returns

None.

### Note

The bottom 4 bits are set to 0, forced by architecture.

# void Xil\_L2CacheFlushRange ( u32 adr, u32 len )

Flush the level 2 cache for the given address range. If the bytes specified by the address range are cached by the L2 cache, the cacheline containing those bytes are invalidated. If the cachelines are modified (dirty), they are written to the system memory before the lines are invalidated.

### **Parameters**

adr	32bit start address of the range to be flushed.
len	Length of the range to be flushed in bytes.

### Returns

None.

### Note

### void Xil\_L2CacheStoreLine ( u32 adr )

Store a level 2 cache line. If the byte specified by the address (adr) is cached by the L2 cache and the cacheline is modified (dirty), the entire contents of the cacheline are written to system memory. After the store completes, the cacheline is marked as unmodified (not dirty).

### **Parameters**

adr	32bit	address of the data/instruction to be stored.
-----	-------	---

### Returns

None.

### Note

The bottom 4 bits are set to 0, forced by architecture.

# **Cortex A9 Processor MMU Functions**

## **Overview**

MMU functions equip users to enable MMU, disable MMU and modify default memory attributes of MMU table as per the need.

# **Functions**

- void Xil\_SetTlbAttributes (INTPTR Addr, u32 attrib)
- void Xil\_EnableMMU (void)
- void Xil\_DisableMMU (void)

## **Function Documentation**

# void Xil\_SetTlbAttributes ( INTPTR Addr, u32 attrib )

This function sets the memory attributes for a section covering 1MB of memory in the translation table.

#### **Parameters**

Addr	32-bit address for which memory attributes need to be set.
attrib	Attribute for the given memory region. xil_mmu.h contains definitions of commonly used memory attributes which can be utilized for this function.

### **Returns**

### Note

The MMU or D-cache does not need to be disabled before changing a translation table entry.

## void Xil\_EnableMMU ( void )

Enable MMU for cortex A9 processor. This function invalidates the instruction and data caches, and then enables MMU.

### **Parameters**

None.	
-------	--

### Returns

None.

### void Xil\_DisableMMU ( void )

Disable MMU for Cortex A9 processors. This function invalidates the TLBs, Branch Predictor Array and flushed the D Caches before disabling the MMU.

#### **Parameters**

### Returns

None.

### Note

When the MMU is disabled, all the memory accesses are treated as strongly ordered.

# **Cortex A9 Time Functions**

# **Overview**

xtime\_I.h provides access to the 64-bit Global Counter in the PMU. This counter increases by one at every two processor cycles. These functions can be used to get/set time in the global timer.

# **Functions**

- void XTime\_SetTime (XTime Xtime\_Global)
- void XTime\_GetTime (XTime \*Xtime\_Global)

# **Function Documentation**

## void XTime\_SetTime ( XTime Xtime\_Global )

Set the time in the Global Timer Counter Register.

### **Parameters**

Xtime_Global	64-bit Value to be written to the Global Timer Counter Register.
--------------	--

### Returns

None.

### Note

When this function is called by any one processor in a multi- processor environment, reference time will reset/lost for all processors.

## void XTime GetTime ( XTime \* Xtime\_Global )

Get the time from the Global Timer Counter Register.

### **Parameters**

ime_Global F	Pointer to the 64-bit location which will be updated with the current timer value.
--------------	--

### Returns

None.

### Note

None.

# **Cortex A9 Event Counter Function**

# **Overview**

Cortex A9 event counter functions can be utilized to configure and control the Cortex-A9 performance monitor events.

Cortex-A9 performance monitor has six event counters which can be used to count a variety of events described in Coretx-A9 TRM. xpm\_counter.h defines configurations XPM\_CNTRCFGx which can be used to program the event counters to count a set of events.

### Note

It doesn't handle the Cortex-A9 cycle counter, as the cycle counter is being used for time keeping.

# **Functions**

- void Xpm\_SetEvents (s32 PmcrCfg)
- void Xpm\_GetEventCounters (u32 \*PmCtrValue)

# **Function Documentation**

## void Xpm\_SetEvents ( s32 PmcrCfg )

This function configures the Cortex A9 event counters controller, with the event codes, in a configuration selected by the user and enables the counters.

### **Parameters**

PmcrCfg	Configuration value based on which the event counters are configured. XPM_CNTRCFG* values defined in xpm_counter.h can be utilized for setting
	configuration.

### Returns

None.

### Note

None.

# void Xpm\_GetEventCounters ( u32 \* PmCtrValue )

This function disables the event counters and returns the counter values.

### **Parameters**

PmCtrValue	Pointer to an array of type u32 PmCtrValue[6]. It is an output parameter which is used to return the PM counter values
	is used to return the PM counter values.

### Returns

None.

### Note

None.

# **PL310 L2 Event Counters Functions**

# **Overview**

xl2cc\_counter.h contains APIs for configuring and controlling the event counters in PL310 L2 cache controller. PL310 has two event counters which can be used to count variety of events like DRHIT, DRREQ, DWHIT,

DWREQ, etc. xl2cc\_counter.h contains definitions for different configurations which can be used for the event counters to count a set of events.

# **Functions**

- void XL2cc\_EventCtrInit (s32 Event0, s32 Event1)
- void XL2cc\_EventCtrStart (void)
- void XL2cc\_EventCtrStop (u32 \*EveCtr0, u32 \*EveCtr1)

# **Function Documentation**

## void XL2cc\_EventCtrInit ( s32 Event0, s32 Event1 )

This function initializes the event counters in L2 Cache controller with a set of event codes specified by the user.

### **Parameters**

Event0	Event code for counter 0.	
Event1	Event code for counter 1.	

### **Returns**

None.

### Note

The definitions for event codes XL2CC\_\* can be found in xl2cc\_counter.h.

# void XL2cc\_EventCtrStart ( void )

This function starts the event counters in L2 Cache controller.

### **Parameters**

None.	
None.	

### **Returns**

None.

### Note

### void XL2cc\_EventCtrStop ( u32 \* EveCtr0, u32 \* EveCtr1 )

This function disables the event counters in L2 Cache controller, saves the counter values and resets the counters.

### **Parameters**

EveCtr0	Output parameter which is used to return the value in event counter 0. EveCtr1:
	Output parameter which is used to return the value in event counter 1.

### Returns

None.

### Note

None.

# **Cortex A9 Processor and pl310 Errata Support**

### **Overview**

Various ARM errata are handled in the standalone BSP. The implementation for errata handling follows ARM guidelines and is based on the open source Linux support for these errata.

### Note

The errata handling is enabled by default. To disable handling of all the errata globally, un-define the macro ENABLE\_ARM\_ERRATA in xil\_errata.h. To disable errata on a per-erratum basis, un-define relevant macros in xil\_errata.h.

# errata definitions

The errata conditions handled in the standalone BSP are listed below

- #define ENABLE ARM ERRATA
- #define CONFIG\_ARM\_ERRATA\_742230
- #define CONFIG\_ARM\_ERRATA\_743622
- #define CONFIG\_ARM\_ERRATA\_775420
- #define CONFIG\_ARM\_ERRATA\_794073
- #define CONFIG\_PL310\_ERRATA\_588369
- #define CONFIG\_PL310\_ERRATA\_727915
- #define CONFIG\_PL310\_ERRATA\_753970

# **Macro Definition Documentation**

### #define CONFIG ARM ERRATA 742230

Errata No: 742230 Description: DMB operation may be faulty

### #define CONFIG\_ARM\_ERRATA\_743622

Errata No: 743622 Description: Faulty hazard checking in the Store Buffer may lead to data corruption.

### #define CONFIG\_ARM\_ERRATA\_775420

Errata No: 775420 Description: A data cache maintenance operation which aborts, might lead to deadlock

### #define CONFIG\_ARM\_ERRATA\_794073

Errata No: 794073 Description: Speculative instruction fetches with MMU disabled might not comply with architectural requirements

### #define CONFIG\_PL310\_ERRATA\_588369

PL310 L2 Cache Errata Errata No: 588369 Description: Clean & Invalidate maintenance operations do not invalidate clean lines

### #define CONFIG PL310 ERRATA 727915

Errata No: 727915 Description: Background Clean and Invalidate by Way operation can cause data corruption

## #define CONFIG\_PL310\_ERRATA\_753970

Errata No: 753970 Description: Cache sync operation may be faulty

# **Cortex A9 Processor Specific Include Files**

The xpseudo\_asm.h includes xreg\_cortexa9.h and xpseudo\_asm\_gcc.h.

The xreg\_cortexa9.h file contains definitions for inline assembler code. It provides inline definitions for Cortex A9 GPRs, SPRs, MPE registers, co-processor registers and Debug registers.

The xpseudo\_asm\_gcc.h contains the definitions for the most often used inline assembler instructions, available as macros. These can be very useful for tasks such as setting or getting special purpose registers, synchronization, or cache manipulation etc. These inline assembler instructions can be used from drivers and user applications written in C.

# Chapter 6

# Cortex A53 32-bit Processor API

# **Overview**

Cortex-A53 standalone BSP contains two separate BSPs for 32-bit mode and 64-bit mode. The 32-bit mode of cortex-A53 is compatible with ARMv7-A architecture.

# **Modules**

- Cortex A53 32-bit Processor Boot Code
- Cortex A53 32-bit Processor Cache Functions
- Cortex A53 32-bit Processor MMU Handling
- Cortex A53 32-bit Mode Time Functions
- Cortex A53 32-bit Processor Specific Include Files

# Cortex A53 32-bit Processor Boot Code

# **Overview**

The boot. S file contains a minimal set of code for transferring control from the processor reset location to the start of the application. The boot code performs minimum configuration which is required for an application to run starting from processor's reset state. Below is a sequence illustrating what all configuration is performed before control reaches to main function.

- 1. Program vector table base for exception handling
- 2. Invalidate instruction cache, data cache and TLBs
- 3. Program stack pointer for various modes (IRQ, FIQ, supervisor, undefine, abort, system)
- 4. Program counter frequency
- 5. Configure MMU with short descriptor translation table format and program base address of translation table
- 6. Enable data cache, instruction cache and MMU
- 7. Transfer control to \_start which clears BSS sections and runs global constructor before jumping to main application

The translation\_table.S file contains a static page table required by MMU for cortex-A53. This translation table is flat mapped (input address = output address) with default memory attributes defined for zynq ultrascale+ architecture. It utilizes short descriptor translation table format with each section defining 1MB of memory. The overview of translation table memory attributes is described below.

	Memory Range	Definition in Translation Table	Note
DDR	0x00000000 - 0x7FFFFFF	Normal write-back Cacheable	For a system where DDR is less than 2GB, region after DDR and before PL is marked as undefined/reserved in translation table
PL	0x80000000 - 0xBFFFFFF	Strongly Ordered	
QSPI, lower PCIe	0xC0000000 - 0xEFFFFFF	Device Memory	
Reserved	0xF0000000 - 0xF7FFFFF	Unassigned	
STM Coresight	0xF8000000 - 0xF8FFFFF	Device Memory	
GIC	0xF9000000 - 0xF90FFFFF	Device memory	
Reserved	0xF9100000 - 0xFCFFFFF	Unassigned	
FPS, LPS slaves	0xFD000000 - 0xFFBFFFFF	Device memory	
CSU, PMU	0xFFC00000 - 0xFFDFFFFF	Device Memory	This region contains CSU and PMU memory which are marked as Device since it is less than 1MB and falls in a region with device memory
TCM, OCM	0xFFE00000 - 0xFFFFFFF	Normal write-back cacheable	

# **Cortex A53 32-bit Processor Cache Functions**

## **Overview**

Cache functions provide access to cache related operations such as flush and invalidate for instruction and data caches. It gives option to perform the cache operations on a single cacheline, a range of memory and an entire cache.

### **Functions**

- void Xil\_DCacheEnable (void)
- void Xil\_DCacheDisable (void)
- void Xil\_DCacheInvalidate (void)
- void Xil\_DCacheInvalidateRange (INTPTR adr, u32 len)
- void Xil\_DCacheInvalidateLine (u32 adr)
- void Xil\_DCacheFlush (void)
- void Xil\_DCacheFlushLine (u32 adr)
- void Xil\_ICacheEnable (void)
- void Xil\_ICacheDisable (void)
- void Xil\_ICacheInvalidate (void)
- void Xil\_ICacheInvalidateRange (INTPTR adr, u32 len)
- void Xil\_ICacheInvalidateLine (u32 adr)

# **Function Documentation**

# void Xil DCacheEnable (void)

Enable the Data cache.

### **Parameters**

None.
-------

### **Returns**

None.

### Note

## void Xil\_DCacheDisable ( void )

Disable the Data cache.

### **Parameters**

### Returns

None.

### Note

None.

## void Xil DCachelnvalidate (void)

Invalidate the Data cache. The contents present in the data cache are cleaned and invalidated.

### **Parameters**

None.	

### Returns

None.

### Note

In Cortex-A53, functionality to simply invalide the cachelines is not present. Such operations are a problem for an environment that supports virtualisation. It would allow one OS to invalidate a line belonging to another OS. This could lead to the other OS crashing because of the loss of essential data. Hence, such operations are promoted to clean and invalidate to avoid such corruption.

## void Xil\_DCacheInvalidateRange ( INTPTR adr, u32 len )

Invalidate the Data cache for the given address range. The cachelines present in the adderss range are cleaned and invalidated.

### **Parameters**

adr	32bit start address of the range to be invalidated.
len	Length of the range to be invalidated in bytes.

### **Returns**

### Note

In Cortex-A53, functionality to simply invalide the cachelines is not present. Such operations are a problem for an environment that supports virtualisation. It would allow one OS to invalidate a line belonging to another OS. This could lead to the other OS crashing because of the loss of essential data. Hence, such operations are promoted to clean and invalidate to avoid such corruption.

## void Xil DCachelnvalidateLine ( u32 adr )

Invalidate a Data cache line. The cacheline is cleaned and invalidated.

### **Parameters**

adr	32 bit address of the data to be invalidated.

### **Returns**

None.

### Note

In Cortex-A53, functionality to simply invalide the cachelines is not present. Such operations are a problem for an environment that supports virtualisation. It would allow one OS to invalidate a line belonging to another OS. This could lead to the other OS crashing because of the loss of essential data. Hence, such operations are promoted to clean and invalidate to avoid such corruption.

# void Xil\_DCacheFlush ( void )

Flush the Data cache.

### **Parameters**

None.	

### Returns

None.

#### Note

## void Xil\_DCacheFlushLine ( u32 adr )

Flush a Data cache line. If the byte specified by the address (adr) is cached by the Data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the entire contents of the cacheline are written to system memory before the line is invalidated.

Parameters		
adr	32bit address of the data to be flushed.	
Returns		
None.		
Note		
The bottom 4 bits are se	t to 0, forced by architecture.	
void Xil_ICacheEnable	e (void)	
Enable the instruction cache.		
Parameters		
None.		
Returns		
None.		
Note		
None.		
void Xil_ICacheDisabl	e ( void )	
Disable the instruction cache.		
Parameters		
None.		
Returns		

Send Feedback

None.

None.

Note

## void Xil\_ICacheInvalidate ( void )

Invalidate the entire instruction cache.

### **Parameters**

### **Returns**

None.

### Note

None.

## void Xil\_ICacheInvalidateRange ( INTPTR adr, u32 len )

Invalidate the instruction cache for the given address range. If the instructions specified by the address range are cached by the instruction cache, the cachelines containing those instructions are invalidated.

### **Parameters**

adr	32bit start address of the range to be invalidated.
len	Length of the range to be invalidated in bytes.

### Returns

None.

### Note

None.

## void Xil\_ICacheInvalidateLine ( u32 adr )

Invalidate an instruction cache line. If the instruction specified by the address is cached by the instruction cache, the cachecline containing that instruction is invalidated.

### **Parameters**

adr	32bit address of the instruction to be invalidated
-----	--

### Returns

None.

### Note

The bottom 4 bits are set to 0, forced by architecture.

Send Feedback

# **Cortex A53 32-bit Processor MMU Handling**

## **Overview**

MMU functions equip users to enable MMU, disable MMU and modify default memory attributes of MMU table as per the need.

# **Functions**

- void Xil\_SetTlbAttributes (INTPTR Addr, u32 attrib)
- void Xil\_EnableMMU (void)
- void Xil\_DisableMMU (void)

## **Function Documentation**

### void Xil\_SetTlbAttributes ( INTPTR Addr, u32 attrib )

This function sets the memory attributes for a section covering 1MB of memory in the translation table.

### **Parameters**

Addr	32-bit address for which the attributes need to be set.	
attrib	Attributes for the specified memory region. xil_mmu.h contains commonly used memory attributes definitions which can be utilized for this function.	

### **Returns**

None.

### Note

The MMU or D-cache does not need to be disabled before changing a translation table entry.

# void Xil\_EnableMMU ( void )

Enable MMU for Cortex-A53 processor in 32bit mode. This function invalidates the instruction and data caches before enabling MMU.

### **Parameters**

None	
INUITE.	

#### Returns

### void Xil\_DisableMMU ( void )

Disable MMU for Cortex A53 processors in 32bit mode. This function invalidates the TLBs, Branch Predictor Array and flushed the data cache before disabling the MMU.

### **Parameters**

None.	

### **Returns**

None.

### Note

When the MMU is disabled, all the memory accesses are treated as strongly ordered.

# **Cortex A53 32-bit Mode Time Functions**

## **Overview**

The xtime\_l.c file and corresponding xtime\_l.h include file provide access to the 64-bit generic counter in Cortex-A53. The sleep.c, usleep.c file and the corresponding sleep.h include file implement sleep functions. Sleep functions are implemented as busy loops.

# **Functions**

- void XTime\_StartTimer (void)
- void XTime\_SetTime (XTime Xtime\_Global)
- void XTime\_GetTime (XTime \*Xtime\_Global)

# **Function Documentation**

## void XTime\_StartTimer ( void )

Start the 64-bit physical timer counter.

### **Parameters**

None.		
-------	--	--

### Returns

None.

### Note

The timer is initialized only if it is disabled. If the timer is already running this function does not perform any operation.

Send Feedback

### void XTime\_SetTime ( XTime Xtime\_Global )

Timer of A53 runs continuously and the time can not be set as desired. This API doesn't contain anything. It is defined to have uniformity across platforms.

### **Parameters**

Xtime_Global	64bit Value to be written to the Global Timer Counter Register.
--------------	---

### Returns

None.

#### Note

None.

### void XTime GetTime ( XTime \* Xtime\_Global )

Get the time from the physical timer counter register.

### **Parameters**

Xtime_Global	Pointer to the 64-bit location to be updated with the current value in physical
	timer counter.

### Returns

None.

### Note

None.

# **Cortex A53 32-bit Processor Specific Include Files**

The xreg\_cortexa53.h file contains definitions for inline assembler code. It provides inline definitions for Cortex A53 GPRs, SPRs and floating point registers.

The xpseudo\_asm\_gcc.h contains the definitions for the most often used inline assembler instructions, available as macros. These can be very useful for tasks such as setting or getting special purpose registers, synchronization, or cache manipulation. These inline assembler instructions can be used from drivers and user applications written in C.

# Chapter 7

# Cortex A53 64-bit Processor API

# **Overview**

Cortex-A53 standalone BSP contains two separate BSPs for 32-bit mode and 64-bit mode. The 64-bit mode of cortex-A53 contains ARMv8-A architecture. This section provides a linked summary and detailed descriptions of the Cortex A53 64-bit Processor APIs.

# **Modules**

- Cortex A53 64-bit Processor Boot Code
- Cortex A53 64-bit Processor Cache Functions
- Cortex A53 64-bit Processor MMU Handling
- Cortex A53 64-bit Mode Time Functions
- Cortex A53 64-bit Processor Specific Include Files

# **Cortex A53 64-bit Processor Boot Code**

# **Overview**

The boot . S file contains a minimal set of code for transferring control from the processor reset location to the start of the application. The boot code performs minimum configuration which is required for an application to run starting from processor's reset state. Cortex-A53 starts execution from EL3 and currently application is also run from EL3. Below is a sequence illustrating what all configuration is performed before control reaches to main function.

- 1. Program vector table base for exception handling
- 2. Set reset vector table base address
- 3. Program stack pointer for EL3
- 4. Routing of interrupts to EL3
- 5. Enable ECC protection
- 6. Program generic counter frequency
- 7. Invalidate instruction cache, data cache and TLBs

- 8. Configure MMU registers and program base address of translation table
- 9. Transfer control to \_start which clears BSS sections and runs global constructor before jumping to main application

# **Cortex A53 64-bit Processor Cache Functions**

## **Overview**

Cache functions provide access to cache related operations such as flush and invalidate for instruction and data caches. It gives option to perform the cache operations on a single cacheline, a range of memory and an entire cache.

## **Functions**

- void Xil\_DCacheEnable (void)
- void Xil\_DCacheDisable (void)
- void Xil\_DCacheInvalidate (void)
- void Xil\_DCacheInvalidateRange (INTPTR adr, INTPTR len)
- void Xil\_DCacheInvalidateLine (INTPTR adr)
- void Xil\_DCacheFlush (void)
- void Xil\_DCacheFlushLine (INTPTR adr)
- void Xil\_ICacheEnable (void)
- void Xil\_ICacheDisable (void)
- void Xil\_ICacheInvalidate (void)
- void Xil\_ICacheInvalidateRange (INTPTR adr, INTPTR len)
- void Xil\_ICacheInvalidateLine (INTPTR adr)

# **Function Documentation**

void Xil_DCacheEnable (	void	)
-------------------------	------	---

Enable the Data cache.

### **Parameters**

None.	

#### Returns

None.

#### Note

## void Xil\_DCacheDisable ( void )

Disable the Data cache.

### **Parameters**

### Returns

None.

### Note

None.

## void Xil DCachelnvalidate (void)

Invalidate the Data cache. The contents present in the cache are cleaned and invalidated.

### **Parameters**

None.	

### Returns

None.

### Note

In Cortex-A53, functionality to simply invalide the cachelines is not present. Such operations are a problem for an environment that supports virtualisation. It would allow one OS to invalidate a line belonging to another OS. This could lead to the other OS crashing because of the loss of essential data. Hence, such operations are promoted to clean and invalidate which avoids such corruption.

## void Xil\_DCacheInvalidateRange ( INTPTR adr, INTPTR len )

Invalidate the Data cache for the given address range. The cachelines present in the adderss range are cleaned and invalidated.

### **Parameters**

adr	64bit start address of the range to be invalidated.
len	Length of the range to be invalidated in bytes.

### **Returns**

### Note

In Cortex-A53, functionality to simply invalide the cachelines is not present. Such operations are a problem for an environment that supports virtualisation. It would allow one OS to invalidate a line belonging to another OS. This could lead to the other OS crashing because of the loss of essential data. Hence, such operations are promoted to clean and invalidate which avoids such corruption.

## void Xil\_DCacheInvalidateLine ( INTPTR adr )

Invalidate a Data cache line. The cacheline is cleaned and invalidated.

### **Parameters**

adr	64bit address of the data to be flushed.

### **Returns**

None.

### Note

In Cortex-A53, functionality to simply invalide the cachelines is not present. Such operations are a problem for an environment that supports virtualisation. It would allow one OS to invalidate a line belonging to another OS. This could lead to the other OS crashing because of the loss of essential data. Hence, such operations are promoted to clean and invalidate which avoids such corruption.

# void Xil\_DCacheFlush ( void )

Flush the Data cache.

### **Parameters**

None.	

### Returns

None.

#### Note

## void Xil\_DCacheFlushLine ( INTPTR adr )

Flush a Data cache line. If the byte specified by the address (adr) is cached by the Data cache, the cacheline containing that byte is invalidated. If the cacheline is modified (dirty), the entire contents of the cacheline are written to system memory before the line is invalidated.

Parameters		
adr	64bit address of the data to be flushed.	
Returns		
None.		
Note		
The bottom 6 bits are se	et to 0, forced by architecture.	
void Xil_ICacheEnable	e ( void )	
Enable the instruction cache.		
Parameters		
None.		
Returns		
None.		
Note		
None.		
void Xil_ICacheDisabl	e ( void )	
Disable the instruction cache.		
Parameters		
None.		
Returns		
None.		

None.

Note

## void Xil\_ICacheInvalidate ( void )

Invalidate the entire instruction cache.

### **Parameters**

None		

### **Returns**

None.

### Note

None.

## void Xil\_ICacheInvalidateRange ( INTPTR adr, INTPTR len )

Invalidate the instruction cache for the given address range. If the instructions specified by the address range are cached by the instruction cache, the cachelines containing those instructions are invalidated.

### **Parameters**

adr	64bit start address of the range to be invalidated.
len	Length of the range to be invalidated in bytes.

### Returns

None.

### Note

None.

# void Xil\_ICacheInvalidateLine ( INTPTR adr )

Invalidate an instruction cache line. If the instruction specified by the parameter adr is cached by the instruction cache, the cacheline containing that instruction is invalidated.

### **Parameters**

	adr	64bit address of the instruction to be invalidated.	
--	-----	---	--

### Returns

None.

### Note

The bottom 6 bits are set to 0, forced by architecture.

# **Cortex A53 64-bit Processor MMU Handling**

## **Overview**

MMU function equip users to modify default memory attributes of MMU table as per the need.

## **Functions**

• void Xil\_SetTlbAttributes (INTPTR Addr, u64 attrib)

# **Function Documentation**

### void Xil\_SetTlbAttributes ( INTPTR Addr, u64 attrib )

brief It sets the memory attributes for a section, in the translation table. If the address (defined by Addr) is less than 4GB, the memory attribute(attrib) is set for a section of 2MB memory. If the address (defined by Addr) is greater than 4GB, the memory attribute (attrib) is set for a section of 1GB memory.

### **Parameters**

Addr	64-bit address for which attributes are to be set.
attrib	Attribute for the specified memory region. xil_mmu.h contains commonly used memory attributes definitions which can be utilized for this function.

### Returns

None.

### Note

The MMU and D-cache need not be disabled before changing an translation table attribute.

# **Cortex A53 64-bit Mode Time Functions**

# **Overview**

The xtime\_l.c file and corresponding xtime\_l.h include file provide access to the 64-bit generic counter in Cortex-A53. The sleep.c, usleep.c file and the corresponding sleep.h include file implement sleep functions. Sleep functions are implemented as busy loops.
